# CORE COMPONENT 2: STRATEGIC MONITORING AND RESEARCH PLAN

## UTAH DIVISION OF WATER QUALITY

### 1 EXECUTIVE SUMMARY

2 Establishing water quality standards for Great Salt Lake, monitoring its water quality, and assessing  
3 its beneficial use support are the primary responsibilities of the Utah Division of Water Quality  
4 (UDWQ) (Utah Administrative Code [UAC] R317-2-7). While UDWQ routinely accomplishes these  
5 tasks for streams and lakes statewide, Great Salt Lake poses UDWQ and its partners with unique  
6 challenges. This component of the Great Salt Lake Water Quality Strategy, the Strategic Monitoring  
7 and Research Plan (also referred to as Component 2), provides UDWQ and its partners with a  
8 strategy to:

- 9  Support the development of water quality standards for Great Salt Lake
- 10  Monitor the waters of Great Salt Lake
- 11  Complete research to assist in assessing Great Salt Lake's health and beneficial uses

12 Implementation of this strategy is critical toward UDWQ fulfilling its responsibilities under the Clean  
13 Water Act (CWA) and moving toward a proactive approach of protecting this valuable resource.

### 14 I. INTRODUCTION

#### 15 1.1 Physical Setting and Study Area

16 Great Salt Lake is a uniquely dynamic terminal lake located adjacent to a rapidly growing  
17 metropolitan area in northern Utah (see Figure 1-1). It is the largest remnant of the ancient Lake  
18 Bonneville, which existed from about 32,000 to 14,000 years ago and once covered about

19 20,000 square miles of western Utah, eastern Nevada, and southern Idaho. A natural dam gave way  
20 about 16,000 years ago, resulting in a large flood that drained much of Lake Bonneville. Increased  
21 evaporation over the following millennia has led to the present-day Great Salt Lake, occupying the  
22 lowest depression in the Great Basin. As is characteristic of terminal lakes, Great Salt Lake has no  
23 outlet; water that flows in can only evaporate or percolate into the substrate.

24 Great Salt Lake is the sixth-largest lake in the United States and the world's fourth-largest terminal  
25 lake. It varies significantly in size and depth as a result of changes in inflow from precipitation,  
26 tributaries, and groundwater, as well as from losses through evaporation. At a lake elevation of  
27 4,200 feet, the lake is about 75 miles long and 30 miles wide and has about 335 miles of shoreline. It  
28 occupies more than 1,700 square miles and contains more than 15 million acre-feet (or almost  
29 5 trillion gallons) of water. Great Salt Lake's shallow depths (its maximum depth is about 35 feet) and  
30 its gradually sloping shoreline result in dramatic surface area variations with any increase or decrease  
31 in lake level. Lake levels fluctuated more than 20 feet between 1873 and 1963, which had elevations  
32 of 4,211.5 and 4,191.35 feet, respectively. The lake's surface area fluctuated between 938 and  
33 2,500 square miles in that same period (Hahl and Handy, 1969). The lake level rose 20.5 feet after  
34 1963 to reach its record high level of 4,211.85 feet on June 3, 1986. The net rise between 1982 and  
35 1986 was 12.2 feet (Arnou and Stephens, 1987).

36 On average, 2.9 million acre-feet of water and 2.2 million tons of salt enter Great Salt Lake each  
37 year. The vast majority of lake inflow typically comes from three drainages—the Jordan River  
38 (9 percent), Weber River (13 percent), and Bear River (39 percent). Additional inflow comes from  
39 groundwater (3 percent), direct precipitation (31 percent), and other minor east-side streams  
40 (5 percent) (Arnou and Stephens, 1987). Because the lake's only substantial water loss mechanism is  
41 evaporation, minerals, salts, and sediments from the watershed accumulate in Great Salt Lake. This  
42 results in lake water that is typically 3 to 7 times saltier than sea water and creates a unique habitat  
43 for biota that has adapted to and relies on the Great Salt Lake ecosystem.

44 Figure 1-1 illustrates the location of various features of Great Salt Lake. It shows Gilbert Bay (also  
45 known as the South Arm), Gunnison Bay (also known as the North Arm), Stansbury Bay, Carrington  
46 Bay, Farmington Bay, Bear River Bay, and Willard Bay. Great Salt Lake wetland areas are generally  
47 located along the eastern shore of Great Salt Lake including areas along Ogden Bay, Farmington  
48 Bay, Bear River Bay, and Willard Spur. The Union Pacific Railroad (UPRR) Causeway separates  
49 Gilbert Bay from Gunnison Bay and Bear River Bay. The Antelope Island causeway at the northern  
50 end of Antelope Island and Island Dike Road at the southern end of Antelope Island separate Gilbert

51 Bay from Farmington Bay. A series of evaporation pond dikes separate Gilbert Bay from what was  
52 historically known as Stansbury Bay.

## 53 1.2 Resources Dependent on Great Salt Lake

54 Great Salt Lake's unique yet harsh conditions are significant to the ecology and economy of our local  
55 region but also the earth's Western Hemisphere. Each of the lake's resources and users of those  
56 resources—including birds, people, the mineral industry, and brine shrimp harvesters—maintain a  
57 fragile balance with the ecology of Great Salt Lake, often dependent on the annual conditions of the  
58 lake for its scale, diversity, and economic value.

59 Millions of birds use the lake as they migrate from breeding grounds as far away as the arctic to  
60 wintering areas as far away as Argentina. For example, up to 1 million Wilson's phalaropes  
61 (*Phalaropus tricolor*)—or more than two-thirds of the world's population—annually migrate through  
62 Great Salt Lake as they travel from the near arctic to the high Andes (Colwell and Jehl, 1994). The  
63 magnitude of the Wilson's phalarope population was a primary factor in the designation of Great  
64 Salt Lake as one of six sites within the Western Hemisphere's Shorebird Reserve Network in the United  
65 States (Aldrich and Paul, 2002). Over half of the world's population of eared grebes (*Podiceps*  
66 *nigricollis*) use Great Salt Lake for up to 4 months during fall migration (Jehl, 1988). In 2007 the  
67 population of eared grebes on Great Salt Lake exceeded 2.5 million birds (N. Darnall, personal  
68 communication, October 15, 2007). Great Salt Lake hosts the largest nesting colony of American  
69 white pelicans (*Pelecanus erythrorhynchos*) west of the continental divide (King and Anderson, 2005)  
70 and the largest breeding population of California gulls (*Larus californicus*) in the world (Aldrich and  
71 Paul, 2002).

72 Opportunities for recreation abound on and around Great Salt Lake. Thousands of people visit the  
73 lake annually to enjoy sailing, hiking, hunting, and watching the diverse bird life. Along the lake are  
74 two state parks, numerous state wildlife refuges, and one federal wildlife refuge. Waterfowl hunting  
75 alone was estimated to be almost an \$8-million industry in 1998 (Isaacson et al., 2002). The total  
76 annual economic effect of recreation of Great Salt Lake was recently estimated to be almost  
77 \$136 million (Bioeconomics, Inc., 2012).

78 As a result of the minerals left behind by evaporation, Great Salt Lake is home to a burgeoning  
79 mineral industry that has a significant impact on Utah's economy (Isaacson et al., 2002). Several  
80 mineral extraction companies currently operating on Great Salt Lake generated a total of about  
81 2.8 million tons of sodium chloride, potassium sulfate, magnesium chloride, magnesium metal, chlorine  
82 gas, and other products—all estimated to be worth about \$300 million in 1995 (Gwynn, 1997). This

83 represents about 16 percent of the annual value of all minerals produced in 1995 in Utah (United  
84 States Geological Survey [USGS], 1995). The total annual economic effect of Great Salt Lake's  
85 mineral industry was recently estimated to be \$1.13 billion (Bioeconomics, Inc., 2012).

87 Great Salt Lake produces a significant portion of the world’s supply of brine shrimp cysts. Commercial  
 88 harvest on the lake began in 1952, and the lake has become an internationally renowned source of  
 89 cysts for their quality as feed for the aquaculture and ornamental fish industry. The market value was  
 90 estimated to average \$8 million to \$11 million annually with an estimated peak value of \$58 million  
 91 in 1995. The annual harvest from Great Salt Lake is often limited by biological factors rather than  
 92 market forces (Isaacson et al., 2002). The total annual economic effect of Great Salt Lake’s brine  
 93 shrimp industry was recently estimated to be almost \$56 million (Bioeconomics, Inc., 2012).

94 Combining the annual economic effect of the three industries previously described, the total annual  
 95 economic output or significance of Great Salt Lake to the state of Utah was estimated to be  
 96 \$1.32 billion. This represents an estimated 7,700 full-time and part-time jobs in the Great Salt Lake  
 97 region and establishes Great Salt Lake as a significant factor in and of significant value to Utah’s  
 98 economy (Bioeconomics, Inc., 2012).

99 **1.3 Need for a Great Salt Lake Monitoring and Research Plan**

100 Increasing development within Great Salt Lake’s watershed and use of its natural resources has not  
 101 only increased pressure on the lake but they have also increased awareness of just how complex,  
 102 dynamic, and flexible the Great Salt Lake ecosystem is. Research continues to show the pressures  
 103 Great Salt Lake faces, the value it represents, and that it poses UDWQ and its partners with a unique  
 104 challenge to protect (Great Salt Lake CMP, 2011; Bioeconomics, Inc., 2012; SWCA, 2012; UDWQ,  
 105 2009; UDWQ, 2011; CH2M HILL, 2008). This Strategic Monitoring and Research Plan was developed  
 106 to enable UDWQ to proactively address this challenge, fulfill its responsibilities in a proactive  
 107 manner, and collaborate with its partners to protect this valuable resource.

108 **1.3.1 Technical and Regulatory Challenges**

109 UDWQ is charged with the responsibility to establish water quality standards for Great Salt Lake,  
 110 monitor its water quality, and assess its beneficial use support (UAC R317-2-7). Due to the unique

111  
 112  
 113  
 114  
 115  
 116  
 117

*UDWQ’s efforts to fulfill its responsibilities on Great Salt Lake have consistently encountered significant technical challenges due to the complexities inherent in Great Salt Lake.*

geochemistry of Great Salt Lake, the direct application of national freshwater quality criteria to the open waters of Great Salt Lake is inappropriate (United States Environmental Protection Agency [EPA] 1987, 2004). Thus, UDWQ has historically used a narrative clause in the state water quality standards to protect

118 the beneficial uses of Great Salt Lake. UDWQ has, however, faced repeated challenges in monitoring  
119 the lake and implementing existing water quality standards to assess the lake's beneficial uses.

120 Questions regarding the applicability of existing freshwater numeric criteria and the ability of the  
121 narrative clause to assess the wetlands of Great Salt Lake led UDWQ to begin development of an  
122 assessment framework for Great Salt Lake impounded wetlands in 2004 (Miller and Hoven, 2007;  
123 UDWQ, 2009; Miller et al., 2011) and evaluate water quality standards for Willard Spur in 2010  
124 (<http://www.willardspur.utah.gov/>). Questions regarding the ability of the narrative clause to address  
125 selenium led to the development of site-specific numeric criteria for selenium for Great Salt Lake in  
126 2006–2008 (CH2M HILL, 2008) and an investigation of mercury in 2009–2011 (UDWQ, 2011). All  
127 of these studies have encountered unique challenges in implementing existing and establishing new  
128 water quality standards, monitoring water quality, and assessing Great Salt Lake's beneficial use  
129 support. Some examples of these challenges include the following:

- 130  Decision making for situations that were not well defined with little or no historical data.
- 131  Typical sampling and laboratory analytical methods were not necessarily applicable for Great  
132 Salt Lake water, as was established in the selenium standard process (Moellmer et al., 2006;  
133 personal communication with USGS, 2011).
- 134  Typical theories as to how selenium and mercury might be processed or cycled by the lake were  
135 found to not apply.
- 136  Existing freshwater numeric criteria for dissolved oxygen and pH were found not to apply to the  
137 impounded wetlands of Great Salt Lake.
- 138  Assessment of beneficial use support in Great Salt Lake wetlands continues to present many  
139 challenges.

140 Using methods and assumptions commonly used for fresh or ocean waters could have led to erroneous  
141 data and decisions that were too protective or not protective enough and did not address the right  
142 source of contaminants (UDWQ, 2011; CH2M HILL, 2008). UDWQ is faced with the reality that an  
143 investment is needed to develop the methods, the data, and a better understanding of Great Salt  
144 Lake to be able to proactively fulfill its responsibilities.

### 145 **1.3.2 Development of a Great Salt Lake Health Index**

146 The Great Salt Lake Advisory Council commissioned a study in 2011 to define the ecological health of  
147 the four bays of Great Salt Lake: Gilbert Bay, Farmington Bay, Bear River Bay, and Gunnison Bay.

148 The study developed a framework for defining the health of Great Salt Lake, based on eight  
149 ecological targets that capture the biological diversity of the lake's ecosystem. These targets were  
150 systemwide lake and wetlands, open water of bays, unimpounded marsh complex, impounded

151 wetlands, mudflats and playas, isolated island habitat for breeding birds, alkali knolls, and adjoining  
152 grasslands and agricultural lands. Based on the findings, most ecological targets surrounding Great  
153 Salt Lake were considered to be in good health; however, some targets, such as the open water of  
154 bays and unimpounded marsh complexes, were found to have a high level of uncertainty due to lack  
155 of historical and current data and scientific understanding. Several habitats were also found to be in  
156 poor or fair health, including the impounded wetlands around Farmington Bay, and the open water of  
157 Gunnison Bay (SWCA, 2011).

158 The study established the need to better understand the current condition and stresses (current and  
159 projected) on Great Salt Lake, not only to better define the health of these ecological targets, but  
160 also to protect Great Salt Lake's beneficial uses. This study illustrates the need for research not only  
161 for UDWQ to proactively fulfill its responsibilities, but for all local, state, and federal entities to fulfill  
162 their responsibilities in protecting this valuable resource.

## 163 1.4 Objectives

164 The objective of the Strategic Monitoring and Research Plan is to enable UDWQ to proactively fulfill  
165 its responsibility to protect Great Salt Lake's water quality and beneficial uses. Specifically, the  
166 Strategic Monitoring and Research Plan provide a strategy to address UDWQ's responsibilities for  
167 Great Salt Lake:

- 168 1. **Support the development of water quality standards for Great Salt Lake.** Identifies monitoring  
169 and research required to support the evaluation of existing water quality standards and identify  
170 the need for and develop new water quality standards for Great Salt Lake as discussed in  
171 Component 1.
- 172 2. **Monitor the waters of Great Salt Lake.** Identifies a plan to provide essential lake assessment  
173 data to determine long-term water quality trends, quantify water quality problems, establish  
174 water quality goals, assess beneficial use support, and determine the effectiveness of pollution  
175 control programs. Identifies research studies to improve upon monitoring methods to improve  
176 consistency and defensibility and better leverage available resources.
- 177 3. **Complete research to support assessing Great Salt Lake's beneficial uses.** Identifies research  
178 required to support the above goals and the assessment of Great Salt Lake's beneficial uses.  
179 These studies will provide an essential understanding of Great Salt Lake's complex  
180 biogeochemistry, hydrology, and ecosystem; its beneficial uses; and how the lake's water quality

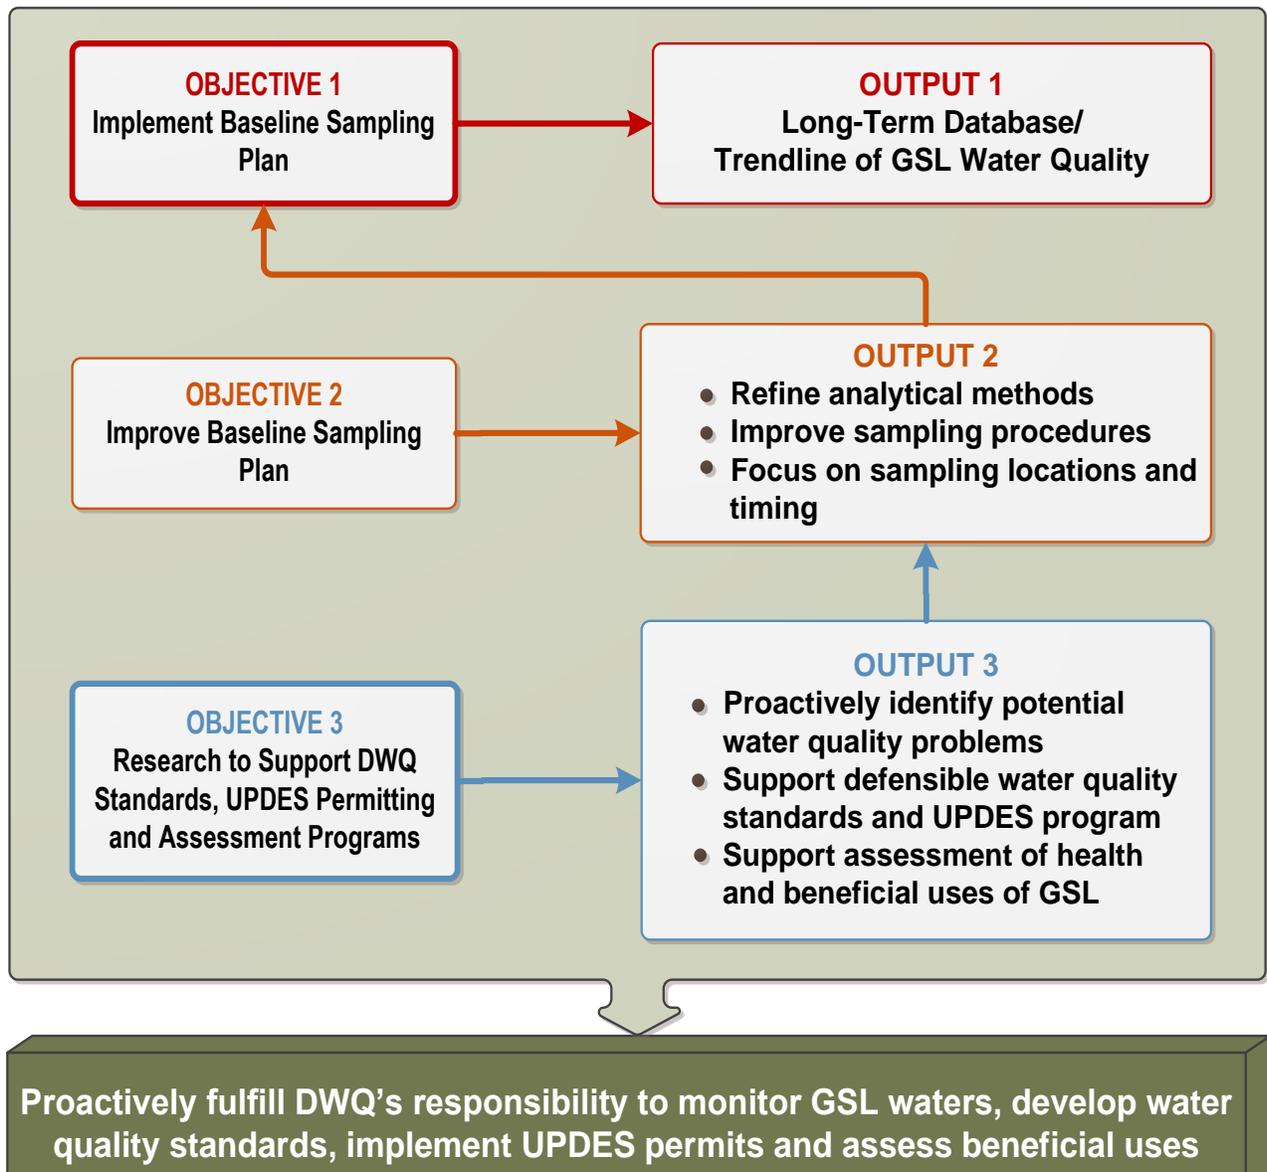

181 may affect them. They provide significant opportunities for collaboration with other local, state,  
182 and federal agencies.

183 While the Strategic Monitoring and Research Plan supports the development of water quality  
184 standards for Great Salt Lake as described in Component 1, it focuses on UDWQ's monitoring and  
185 assessment responsibilities for Great Salt Lake. It works to answer the following key questions:

- 186  What is the current water quality condition of Great Salt Lake and how does it change seasonally  
187 and spatially?
- 188  How can the accuracy, reliability, and quality of sampling and analyzing various parameters in  
189 the complex and dynamic ecosystem of the Great Salt Lake be improved?
- 190  What areas of research are required to help evaluate and develop water quality standards,  
191 better focus monitoring efforts, and assess the lake's health and beneficial uses?

192 The specific objectives of the Strategic Monitoring and Research Plan are summarized in Figure 1-2  
193 and are detailed as follows.

194 FIGURE 1-2. GREAT SALT LAKE SAMPLING PLAN TASK SUMMARY

195  
196

197 **1.4.1 Objective 1—Implement Baseline Sampling Plan**

198 This objective is of highest priority and will be integrated into UDWQ’s annual monitoring program.  
 199 The objective is to sample a set of key water quality parameters in Great Salt Lake and its wetlands  
 200 to determine long-term water quality trends, quantify water quality problems, establish water quality  
 201 goals, assess beneficial use support, and determine the effectiveness of pollution control programs.  
 202 Implementation of this plan is the foundation to proactively fulfilling UDWQ’s responsibilities for  
 203 Great Salt Lake.

204 Key parameters and contaminants were determined based on results of previous studies conducted  
205 by UDWQ and other agencies and include those that are currently identified to be at highest risk to  
206 the lake's beneficial uses. Standard operating procedures (SOPs) were identified that can be  
207 implemented consistently by all organizations sampling and monitoring Great Salt Lake to ensure  
208 consistent quality and facilitate cross-agency use of the data. The baseline sampling plan includes the  
209 following:

- 210  Data quality objectives (DQOs) that define and establish the basis for the baseline sampling  
211 program
- 212  A work plan to meet the DQOs
- 213  Details on sampling locations and frequency
- 214  SOPs for sampling and analyzing key water quality parameters and contaminants
- 215  A Quality Assurance Project Plan (QAPP)

#### 216 **1.4.2 Objective 2—Improve Baseline Sampling Plan**

217 This objective is of second highest priority. The identified research studies will work toward refining  
218 and improving the baseline sampling plan and analytical procedures for key contaminants in the lake.  
219 These studies fill numerous gaps and are essential to improving UDWQ's ability to monitor Great Salt  
220 Lake and proactively develop water quality standards, Utah Pollution Discharge Elimination System  
221 (UPDES) permits, and assess Great Salt Lake's beneficial uses. Specific objectives are as follows:

- 222  Identify gaps in accuracy and reliability of existing sampling and analytical procedures for the  
223 Great Salt Lake
- 224  Complete studies to verify and confirm or improve the standard sampling procedures and  
225 laboratory analytical methods for accurate representation of the unique water quality of Great  
226 Salt Lake
- 227  Complete studies to verify and confirm or improve sampling locations, sampling time and  
228 frequency, and contaminants that are monitored through the baseline sampling plan

#### 229 **1.4.3 Objective 3—Research to Support UDWQ Standards, UPDES Permitting, and** 230 **Assessment Programs**

231 Numerous questions asked during previous investigations remain unanswered, and answers are  
232 essential to developing water quality standards, improving monitoring activities, and assessing the  
233 health and beneficial uses of Great Salt Lake. Some of these studies have already been initiated or  
234 are being completed by UDWQ and other agencies. That does not negate the need for UDWQ to  
235 encourage or support their completion for it to fulfill its responsibilities. These studies will be

236 implemented depending on priority and available funding. The specific objectives of this task include  
237 the following:

- 238  Complete research to proactively identify potential water quality problems.
- 239  Complete research required to support the evaluation and development of defensible water  
240 quality standards. The standards directly support the UPDES program by establishing discharge  
241 limits for pollutants to the lake.
- 242  Complete research required to effectively and defensibly assess the health and beneficial uses of  
243 Great Salt Lake.

## 244 1.5 Prioritization of Monitoring and Research Needs

245 UDWQ has undertaken a significant effort over the last several years to engage its partners and the  
246 stakeholders of Great Salt Lake to better understand their objectives, plans, needs, issues, and  
247 concerns and incorporate them into the Strategic Monitoring and Research Plan. Component 2 is the  
248 result of integrating this input with UDWQ's current understanding of Great Salt Lake and its  
249 responsibilities under the CWA.

250 As previously described, UDWQ's highest priority is to implement the baseline sampling plan and then  
251 complete studies to improve on it. This work is critical to shifting UDWQ from reacting to possible  
252 water quality problems toward proactively monitoring, developing standards, and assessing Great  
253 Salt Lake's beneficial uses. Table 1-2 provides a summary of how studies for Objectives 1 and 2 are  
254 prioritized with a suggested timeline for completion.

255 Additional research studies were identified to address Objective 3. Each of these studies is important  
256 and helps achieve the stated objectives. However, in an environment where funds are not always  
257 available, it is necessary to prioritize efforts. Table 1-3 provides a summary of how studies for  
258 Objective 3 are prioritized with a timeline for completion. It is important to note that some of these  
259 studies are already being implemented by UDWQ and/or others in response to critical needs, thus  
260 their high priority is implied by this action. Those projects that are currently being led by others are  
261 noted. They require UDWQ's support but not necessarily significant involvement. Some of the studies  
262 will be necessary to implement if the lake is listed on the 303(d) list as impaired for its beneficial use  
263 and a Total Maximum Daily Load Analysis is required to quantify sources and loading to the lake. The  
264 remaining studies are prioritized based on existing issues that UDWQ must address and its need to  
265 proactively develop water quality standards and assess Great Salt Lake's beneficial uses.

266 The recommended timeline for completion is identified only as a guideline as some studies provide  
267 information that are a prerequisite for others. All studies are subject to discussion and coordination

268 within UDWQ and its partners and available funding. It is recognized that extenuating circumstances  
 269 may cause UDWQ to reprioritize efforts to address needs as they arise.

TABLE 1-2. PRIORITIZATION OF STUDIES FOR OBJECTIVES 1 AND 2

Priority	Study Description	Location in Document (Section No.)	Recommended Timeline
<b>Objective 1 – Implement Baseline Sampling Plan</b>			
1	Implement Baseline Sampling Plan	2.0	Began in 2011, continuing
<b>Objective 2 – Improve Baseline Sampling Plan</b>

## 271 1.6 Document Organization

272 The remainder of this document is organized into the following sections:

- 273  **Section II** provides the Great Salt Lake baseline sampling plan (Objective 1).
- 274  **Section III** provides recommendations to refine and improve the baseline sampling plan (Objective  
275 2).
- 276  **Section IV** identifies key research needs for Great Salt Lake as they pertain to UDWQ's  
277 responsibilities (Objective 3).
- 278  **Section V** provides a list of the references cited in this document.

## 279 II. BASELINE SAMPLING PLAN 280 FOR THE OPEN WATERS OF GREAT SALT LAKE

281 Monitoring the water quality of Great Salt Lake, and thus the development and implementation of a  
282 baseline sampling plan, is a critical responsibility of UDWQ and a critical element in UDWQ's  
283 strategy to protect the water quality of Great Salt Lake. This plan will provide for the routine  
284 collection of environmental samples and reporting of concentrations of key contaminants of concern in  
285 the water, macroinvertebrates, and bird eggs that are indicative of the water quality of the open  
286 waters of Great Salt Lake. The activities described in this section will enable UDWQ to determine  
287 long-term water quality trends, quantify water quality problems, establish water quality goals, assess  
288 beneficial use support, and determine the effectiveness of pollution control programs.

289 While UDWQ is currently also sampling Great Salt Lake wetlands, the assessment framework for  
290 these wetlands is still in development and will be described elsewhere. This section summarizes  
291 UDWQ's baseline sampling for the open waters of Great Salt Lake.

### 292 2.1 Introduction

#### 293 2.1.1 Background

294 The importance of the complex yet unique characteristics of Great Salt Lake to migratory birds, local  
295 recreation, brine shrimp, and mineral industries and its significance to the ecology and economy of the  
296 region is well documented (Colwell and Jehl, 1994; USGS, 1995; Jehl, 1988; Aldrich and Paul, 2002;  
297 Isaacson et al., 2002). Millions of birds use the lake water and its surrounding wetlands every year as  
298 they migrate from breeding grounds as far away as the Arctic to wintering areas as far away as  
299 Argentina. Recreational opportunities abound on and around the lake, which attracts thousands of  
300 visitors annually to enjoy sailing, hiking, hunting, and watching the diverse bird life. Great Salt Lake is  
301 also home to the mineral and brine shrimp industries, which also make significant contributions to Utah's  
302 economy (Bioeconomics, Inc., 2012).

303 These same complex and unique characteristics also make it challenging for UDWQ to develop water  
304 quality standards, monitor the lake's water quality, and assess the lake's beneficial uses. Existing  
305 freshwater standards are generally not applicable. Only one numeric criterion (selenium) has been  
306 adopted for the lake at the writing of this plan, leaving UDWQ with a narrative clause for use in its  
307 assessments. A lack of long-term data and scientific uncertainty about the fate and transport of  
308 contaminants in the lake and its associated food web further complicate UDWQ's assessments.

309 What was first considered a relatively simple ecosystem composed of algae, brine shrimp, brine flies,  
310 and bird life is now understood to be quite complex and dynamic. UDWQ needs a baseline sampling  
311 program for Great Salt Lake that will provide the following:

- 312  Establish a public, long-term database of the lake's water quality that will enable UDWQ to  
313 determine long-term water quality trends, quantify water quality problems, establish water  
314 quality goals, assess beneficial use support, and determine the effectiveness of pollution control  
315 programs
- 316  Confirm appropriate sampling and analytical techniques of various matrices and target  
317 contaminants in the lake
- 318  Support the development of water quality standards and the assessment of Great Salt Lake's  
319 health and beneficial uses
- 320  Facilitate a collaborative approach with partner agencies

### 321 **2.1.2 Baseline Sampling Program Objectives**

322 The objective of the baseline sampling program is to enable UDWQ to collect environmental samples  
323 to determine long-term water quality trends, quantify water quality problems, establish water quality  
324 goals, assess beneficial use support, and determine the effectiveness of pollution control programs.

325 This sampling plan defines the DQOs, sampling procedures, analytical procedures, safety  
326 considerations, and documentation and reporting requirements to be implemented by UDWQ as part  
327 of this program.

### 328 **2.1.3 Study Area**

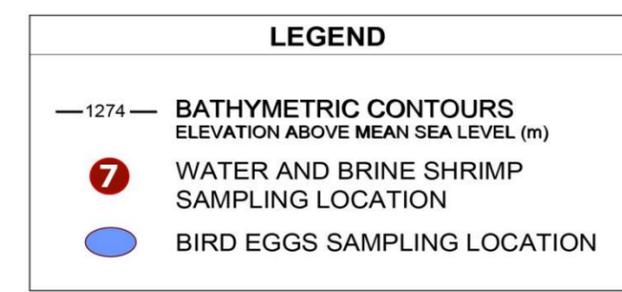

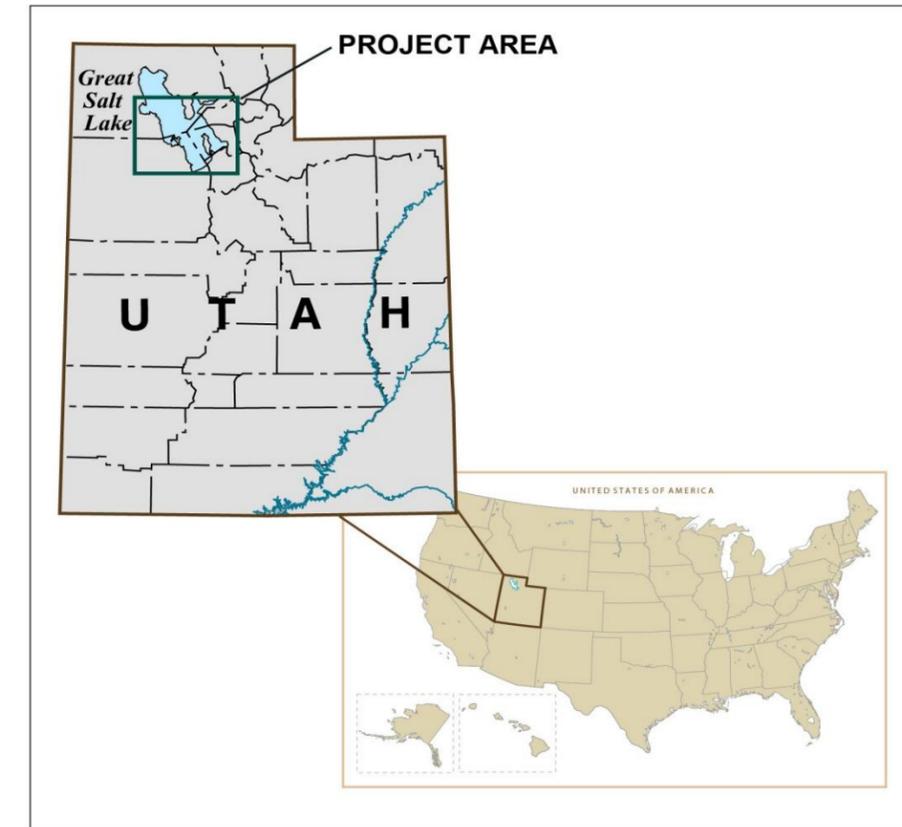

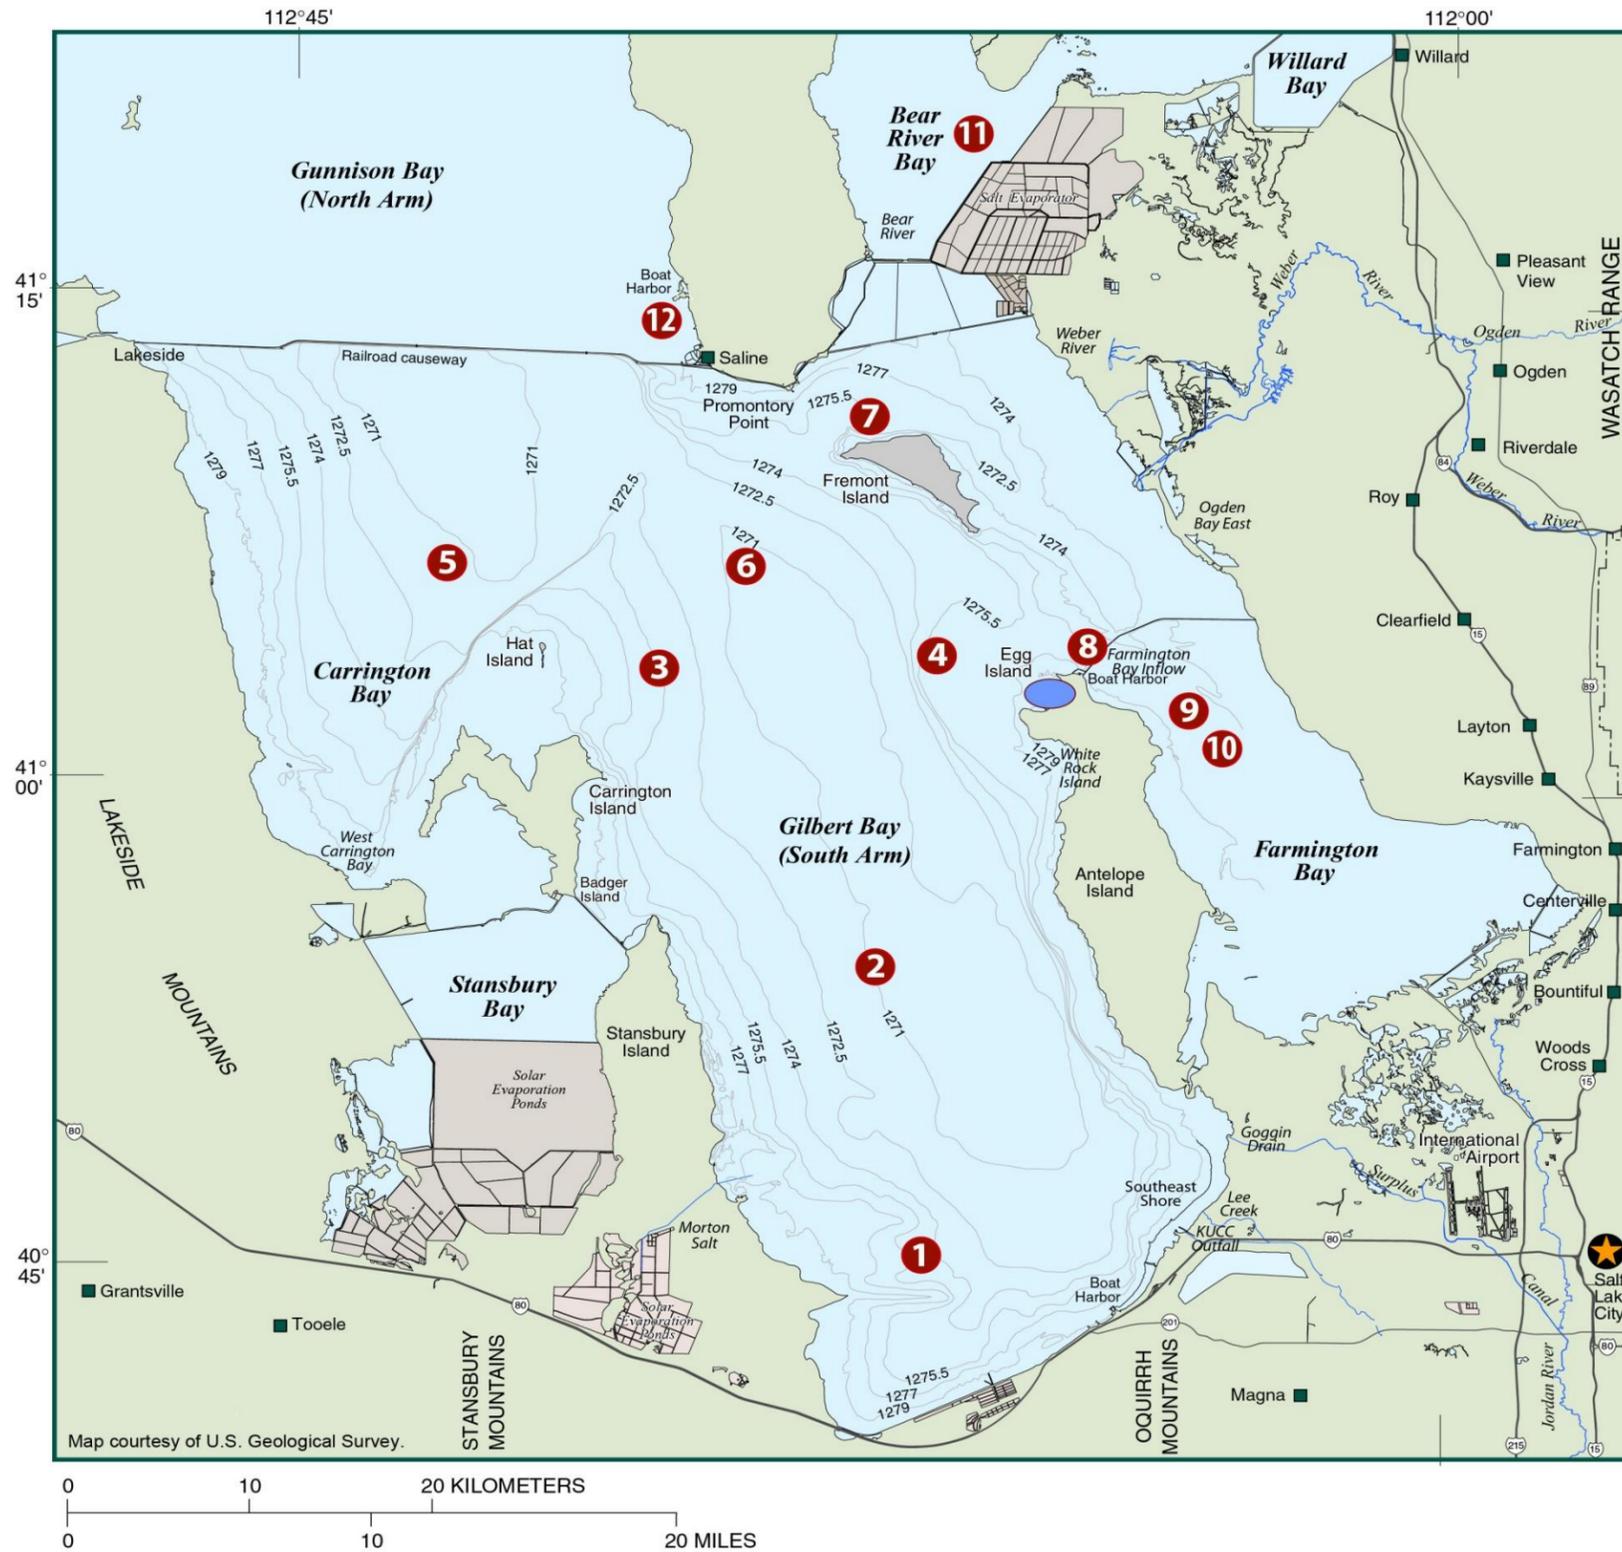

329 Figure 2-1 shows the study area for the baseline sampling program. It includes the "open waters of  
330 Great Salt Lake" defined as Gilbert Bay (Class 5A), Gunnison Bay (Class 5B), Farmington Bay  
331 (Class 5D), and Bear River Bay (Class 5C) and is generally bounded by the shoreline as defined by  
332 the current lake water level but an area no greater than as represented by the lake's bed elevation  
333 of 4,208 feet per UDWQ's segmentation of the waters of Great Salt Lake (UAC R317-2-6). The  
334 UPRR Causeway separates Gilbert Bay from Gunnison Bay and Bear River Bay. The Antelope Island  
335 Causeway at the northern end of Antelope Island and Island Dike Road at the southern end of  
336 Antelope Island separate Gilbert Bay from Farmington Bay. A series of evaporation pond dikes  
337 separate Gilbert Bay from what was historically known as Stansbury Bay.

## 338 2.2 Data Quality Objectives

339 The EPA's seven-step DQO process (EPA, 2006) was used to guide the requirements and design  
340 rationale for the Great Salt Lake baseline sampling program. The DQOs define the type, quantity,  
341 and quality of data and establish performance and acceptance criteria to ensure that data collected  
342 support the goals of the study.

343 Table 2-1 details the DQOs for this sampling plan.

TABLE 2-1. DQOs FOR GREAT SALT LAKE BASELINE SAMPLING PROGRAM

Step	DQOs for Great Salt Lake Baseline Sampling Program
<p><b>1. Problem Statement</b></p>	<p><b>Problem</b></p> <p>Several contaminants of concern, such as nutrients, selenium, mercury, and other trace metals, are known to cause adverse effects on the biological health and the beneficial uses of some water bodies and are known to exist in the waters of Great Salt Lake. Little is known about existing concentrations of these contaminants in Great Salt Lake, their temporal and spatial variability, and their fate and transport. Great Salt Lake’s unique and complex water chemistry has made assessing these contaminants and tracking their long-term variability difficult and precluded the use of typical numeric water quality standards to manage Great Salt Lake’s water quality. This has resulted in a dearth of data that often results in a reactive approach to managing its water quality and makes the assessment of the water quality in Great Salt Lake extremely difficult. These uncertainties resulted in a large expenditure of resources to develop the criterion for selenium. Great Salt Lake is protected by a narrative water quality standard and currently has only one site-specific numeric water quality standard for selenium in Gilbert Bay (UAC R317-2-14).</p> <p>A long-term database of water quality measures (including water and biota tissue chemistry) is needed to assess long-term trends and enable UDWQ to fulfill its responsibilities. A long-term strategy to monitor selenium concentrations in bird eggs is needed to comply with the existing numeric criterion. Proven protocols are needed to enable the consistent collection and analysis of environmental samples from Great Salt Lake. Research is needed to better understand the idiosyncrasies of Great Salt Lake’s ecosystem and how they relate to water quality. These tools are needed to better understand the ecosystem and identify reliable measures that can be used to assess its health.</p> <p><b>Project Team</b></p> <p>It is UDWQ’s objective to collaborate and coordinate with various state and federal agencies that have management responsibilities, conduct research, and monitor the condition of Great Salt Lake. The following agencies are identified as potential partners in completing a baseline sampling program and developing protocols for future monitoring of the health of Great Salt Lake:</p> <ul style="list-style-type: none"> <li>• Utah Division of Wildlife Resources (UDWR)</li> <li>• Utah Division of Forestry, Fire, and State Lands</li> <li>• Utah Geological Survey</li> <li>• Davis County Health Department</li> <li>• USGS</li> <li>• United States Fish and Wildlife Service (USFWS)</li> </ul> <p><b>Available Resources</b></p> <p>UDWQ will seek to collaborate with partner agencies to provide the resources required for the baseline sampling program. UDWQ will include funds for the proposed baseline sampling program in its annual budget. Monies for supplemental studies will be appropriated on an as-needed basis.</p>

TABLE 2-1. DQOs FOR GREAT SALT LAKE BASELINE SAMPLING PROGRAM

Step	DQOs for Great Salt Lake Baseline Sampling Program
	<p><b>Relevant Deadlines</b></p> <p>UDWQ began implementation in Spring 2011 and will continue on an annual basis. A report providing a summary and evaluation of analytical results will be provided to UDWQ to provide adequate time for inclusion in the preparation of the State of Utah’s biennial 305(b) report.</p>
<p><b>2. Goal of the Study/Decision Statements</b></p>	<p><b>Key Questions</b></p> <p>The overall question to be resolved can be stated as, “What is the overall water quality of the open waters of Great Salt Lake?” The following more specific questions will be addressed by the baseline sampling program:</p> <ul style="list-style-type: none"> <li>• What are the concentrations of potential contaminants of concern (i.e., nutrients, selenium, mercury, etc.) in Great Salt Lake’s water or the brine shrimp and the eggs of nesting birds?</li> <li>• How do these concentrations vary spatially, seasonally, and annually?</li> </ul> <p><b>Possible Outcomes</b></p> <ul style="list-style-type: none"> <li>• Information obtained from the sampling efforts is adequate to accurately quantify concentrations of contaminants in Great Salt Lake. Data are useful for management decisions, a better understanding of Great Salt Lake’s ecosystem, and guiding future research.</li> <li>• Information obtained from the sampling efforts is not adequate to accurately quantify concentrations of identified contaminants in Great Salt Lake. Steps will be taken to improve and/or develop appropriate sampling and analytical methods for Great Salt Lake and revise the baseline sampling program as needed.</li> <li>• Information obtained is adequate to understand the spatial and temporal variation of identified contaminants in the lake.</li> <li>• Information obtained is not adequate to understand the spatial and temporal variation of pollutants in the lake. Steps are taken to prioritize research needs to understand these variations better and revise baseline sampling program as needed.</li> </ul>
<p><b>3. Inputs to the Decision</b></p>	<p><b>Informational Inputs</b></p> <p>The following information will be collected:</p> <ul style="list-style-type: none"> <li>• Water and brine shrimp samples will be sampled biannually at 12 locations in Great Salt Lake as shown in Figure 2-1—Once during the bird nesting season (in the month of June) and once during the fall brine shrimp cyst harvest (in the month of October). An assessment framework (see Figure 2-3) will be used to determine if water and brine shrimp sampling will be completed at more locations and on a more frequent basis.</li> <li>• A minimum of five (preferably eight) bird eggs each will be collected from American avocets and black-necked stilts at two locations: Bridger Bay on Antelope Island and Saltair as shown in Figure 2-1. This will be completed during bird nesting season (April through June) at a minimum of once every 2 years. An assessment framework (see Figure 2-3) will be used to determine</li> </ul>

TABLE 2-1. DQOs FOR GREAT SALT LAKE BASELINE SAMPLING PROGRAM

Step	DQOs for Great Salt Lake Baseline Sampling Program
	<p>if egg sampling will be completed every year and if changes will be made in how many eggs will be collected and from how many locations.</p> <p><b>Variables/Characteristics to Be Measured</b></p> <p>Total selenium and mercury concentrations in the following:</p> <ul style="list-style-type: none"> <li>• Water</li> <li>• Brine shrimp</li> <li>• Bird eggs</li> </ul> <p>Methyl-mercury concentration in the following:</p> <ul style="list-style-type: none"> <li>• Water</li> </ul> <p>Trace metals (at a minimum total arsenic, total copper, cadmium, lead, and thallium; others included if part of the same analysis suite) concentration in the following:</p> <ul style="list-style-type: none"> <li>• Water</li> <li>• Brine shrimp</li> </ul> <p>Nutrient (total nitrogen, total phosphorus, and ammonia) and chlorophyll-a concentrations in the following:</p> <ul style="list-style-type: none"> <li>• Water</li> </ul> <p>Dissolved oxygen, pH, temperature, conductivity, secchi depth, total water depth, and the depth of deep brine layer (if present) will be measured in water as well.</p> <p>Report dry-weight concentrations and moisture percentage of biota samples.</p>
<p><b>4. Study Boundaries</b></p>	<p>The study area for this project is shown in Figure 2-1. This area includes the Gilbert Bay or the South Arm, Farmington Bay, Bear River Bay, and Gunnison Bay (i.e., the North Arm).</p> <p><b>Temporal</b></p> <ul style="list-style-type: none"> <li>• Water and brine shrimp samples will be sampled semiannually—once during the bird nesting season (June) and once during the fall brine shrimp cyst harvest (October). An assessment framework (see Figure 2-3) will be used to determine if sampling will be completed more frequently.</li> <li>• Bird eggs will be collected during nesting season (April through June) a minimum of once every 2 years. An assessment framework (see Figure 2-3) will be used to determine if sampling will be completed more frequently.</li> </ul> <p><b>Practical Constraints on Data Collection</b></p> <ul style="list-style-type: none"> <li>• Availability of boats and other field equipment, as well as equipment functionality, may limit some activities.</li> </ul>

TABLE 2-1. DQOs FOR GREAT SALT LAKE BASELINE SAMPLING PROGRAM

Step	DQOs for Great Salt Lake Baseline Sampling Program
	<ul style="list-style-type: none"> <li>• Staffing and funding availability will need to be confirmed.</li> <li>• Weather is a major constraint for all sampling and monitoring activities because storms can limit ability to safely conduct sampling and measurement activities at the study area.</li> <li>• Great Salt Lake levels may be a constraint and affect sampling locations. Currently, there is no readily available access to Gunnison Bay. Gunnison Bay samples will be collected as opportunities arise but no regular sampling location is identified.</li> <li>• Successfully obtain collection permits from USFWS.</li> <li>• The presence of bird eggs and sufficient mass of macroinvertebrates needed for sample analysis may be a constraint.</li> <li>• Not all sampling and analytical methods are fully tested and confirmed.</li> </ul>
<p><b>5. Decision Rules</b></p>	<ul style="list-style-type: none"> <li>• If information is adequate to accurately quantify the concentration of contaminants of concern for Great Salt Lake, UDWQ will complete reporting as noted.</li> <li>• If information is not adequate to accurately quantify the concentration of contaminants of concern for Great Salt Lake, UDWQ will evaluate results, revise methods, develop appropriate sampling and analytical methods for Great Salt Lake, revise the baseline sampling program as needed, and complete reporting as noted.</li> </ul>
<p><b>6. Tolerable Limits on Decision Rules</b></p>	<p>Data quality may also be specified under measurement quality objectives. This quality assessment typically involves specifying performance criteria in terms of the precision, accuracy, representativeness, completeness, and comparability of the data. These performance criteria provide a measure of how well the established measurement quality objectives were met.</p> <p>For this investigation, measurement quality objectives for chemical measurements will be specified in the QAPP; in general, the measurement quality objectives for selenium and trace metals are about <math>\pm 20</math> percent, for total mercury are about <math>\pm 24</math> percent, and for methyl mercury are about <math>\pm 35</math> percent. The QAPP will specify all quality assurance/quality control objectives for sample measurement based on each matrix and may be more restrictive or less restrictive than <math>\pm 20</math> percent.</p>
<p><b>7. Optimization of the Sampling Design</b></p>	<p>The baseline sampling program includes the collection and analysis of water, brine shrimp, and bird egg samples to monitor the water quality of Great Salt Lake and assess its condition with respect to water quality standards. An assessment framework is included that allows UDWQ to adapt the baseline sampling program to specific concentrations of selenium observed in Great Salt Lake. UDWQ's strategy for Great Salt Lake includes supplemental studies that are intended to improve implementation and interpretation of results from the baseline sampling program.</p>

## 347 2.3 Contaminants of Concern

348 Several studies and monitoring programs have identified contaminants that may adversely affect  
 349 Great Salt Lake's ecology and its beneficial uses. As the public has become more aware of the  
 350 importance of Great Salt Lake, they too have begun to express concerns about the lake's water  
 351 quality condition. Table 2-2 provides a summary of selected recent literature that has investigated  
 352 and identified contaminants of concern that could potentially adversely affect the Great Salt Lake  
 353 ecosystem.

TABLE 2-2. CONTAMINANTS TO BE MONITORED IN THE GREAT SALT LAKE BASELINE SAMPLING PLAN

Contaminants	Literature
Selenium	Cavitt, 2006; Marden, 2007; Cavitt, 2008a; Cavitt 2008b; CH2M HILL, 2008; Conover et al., 2008a; Conover et al., 2008b; Conover 2008c; Marden, 2008; Naftz et al, 2009b; Vest et al., 2009; Diaz et al., 2009a; Diaz et al., 2009b
Total and Methyl-Mercury	CH2M HILL, 2008; Naftz et al., 2008; Naftz et al., 2009a; Vest et al., 2009; UDWQ, 2011
Trace Metals	Johnson et al. 2008; Naftz et al., 2009b; USGS, 2004; Vest et al., 2009; Beisner et al., 2009
Nutrients	Naftz et al., 2008; Wurtsbaugh et al., 2009

### 354 2.3.1 Selenium

355 A numeric water quality criterion for selenium was established for Great Salt Lake in UAC R317-2-14  
 356 in November 2008. This standard was developed through an extensive process led by a Selenium  
 357 Steering Committee composed of prominent stakeholders who were advised by a scientific panel of  
 358 selenium experts (CH2M HILL, 2008). The selenium water quality criterion of 12.5 milligrams per  
 359 kilogram is a tissue-based standard based on the complete egg/embryo of aquatic-dependent birds  
 360 that use the waters of Gilbert Bay (Class 5A). UDWQ's objective is to continue to protect Great Salt  
 361 Lake for selenium by monitoring egg tissue from aquatic-dependent birds, refining the trophic transfer  
 362 model through ecosystem monitoring, evaluating trigger selenium concentrations that initiate various  
 363 monitoring, assessment and management actions, and identifying management actions to mitigate  
 364 further increases in selenium concentrations. The baseline sampling program will work toward  
 365 developing a long-term database to assess bird egg concentrations and address these objectives.

### 366 **2.3.2 Mercury**

367 Mercury, a global pollutant that ultimately makes its way into every aquatic ecosystem through the  
368 hydrologic cycle, is also a contaminant of concern in Great Salt Lake. After a 2003 USGS study found  
369 elevated concentrations of total and methyl-mercury in the waters and evidence of its bioaccumulation  
370 in the biota of Great Salt Lake (Naftz et al., 2008; Naftz et al., 2009), UDWQ began an endeavor  
371 to understand the extent to which mercury poses a risk to the Great Salt Lake aquatic birds and  
372 organisms in their forage base (UDWQ, 2011). Several other studies as indicated in Table 2-2 have  
373 also concluded that mercury is a significant contaminant of concern in Great Salt Lake. Questions still  
374 remain on whether avian species are exposed to mercury at Great Salt Lake or elsewhere. More  
375 research needs to be done on avian species that feed primarily on brine shrimp and brine flies, as  
376 well as on the relationship between selenium and mercury. UDWQ's objective is to continue sampling  
377 and monitoring of total and methyl-mercury in the Great Salt Lake ecosystem.

### 378 **2.3.3 Trace Metals**

379 Though little is known about the input and biogeochemical cycling of trace elements in the lake, there  
380 are concerns about the negative effect of these constituents in Great Salt Lake. A study by USGS and  
381 others completed from 1998 to 2001 evaluated water quality and completed a biological assessment  
382 of the Great Salt Lake basin (Waddell et al., 2004). This study concluded that most streambed  
383 sediments had concentrations of arsenic, cadmium, copper, lead, mercury, silver, and zinc that  
384 exceeded aquatic life guidelines. Naftz et al. (2000) also found that deposition of contaminated  
385 sediment in the Farmington Bay area with elevated concentrations of cadmium, copper, lead, zinc,  
386 nitrogen, organic carbon, and phosphorus. Deposition began to increase sometime in the early to mid-  
387 1900s and became progressively greater in recently deposited sediment, illustrating the impact of  
388 trace metals on the lake with increased urbanization. In addition, in a recent article, Vest et al. (2009)  
389 found elevated arsenic levels in wintering waterfowls of Great Salt Lake. UDWQ's objective is to  
390 prioritize the tracking of current and changing concentrations of arsenic and copper to proactively  
391 protect the lake from these potential contaminants. Other trace metals are of concern but will be  
392 tracked as resources are available.

### 393 **2.3.4 Nutrients**

394 Similar to the trace metals, little is known with regard to the variability, fate, and transport of nutrients  
395 in the open waters of Great Salt Lake. A few studies by Wurtsbaugh et al. have assessed Farmington  
396 Bay of Great Salt Lake and identified it to be hypereutrophic with blooms of toxic cyanobacteria and  
397 measurable concentrations of cyanotoxins (Wurtsbaugh et al., 2006; Wurtsbaugh et al., 2009). These

398 studies have also estimated the impact of excess nutrients in Farmington Bay on the Great Salt Lake  
 399 ecosystem via its connectivity with the other bays. The UDWR continues work to evaluate the impact of  
 400 nutrients on the brine shrimp industry. Tracking nutrient concentrations are thus important to UDWQ to  
 401 better understand nutrient cycling and effects in the lake.

### 402 2.3.5 Summary

403 The baseline sampling program's focus will be to monitor concentrations of potential contaminants in  
 404 the waters, brine shrimp, and aquatic-dependent bird eggs of Great Salt Lake as described in  
 405 Table 2-3.

TABLE 2-3. CONTAMINANTS TO BE MONITORED IN WATER, BRINE SHRIMP, AND BIRD EGGS OF OPEN WATERS OF GREAT SALT LAKE

Matrix	Analytes
Water	Total selenium, total and methyl-mercury, total arsenic, total copper, cadmium, lead, thallium, total phosphorus, total nitrogen, ammonia, and chlorophyll-a
Brine Shrimp	Total selenium, total mercury, total arsenic, total copper, cadmium, lead, and thallium
Bird Eggs	Total selenium and total mercury

406

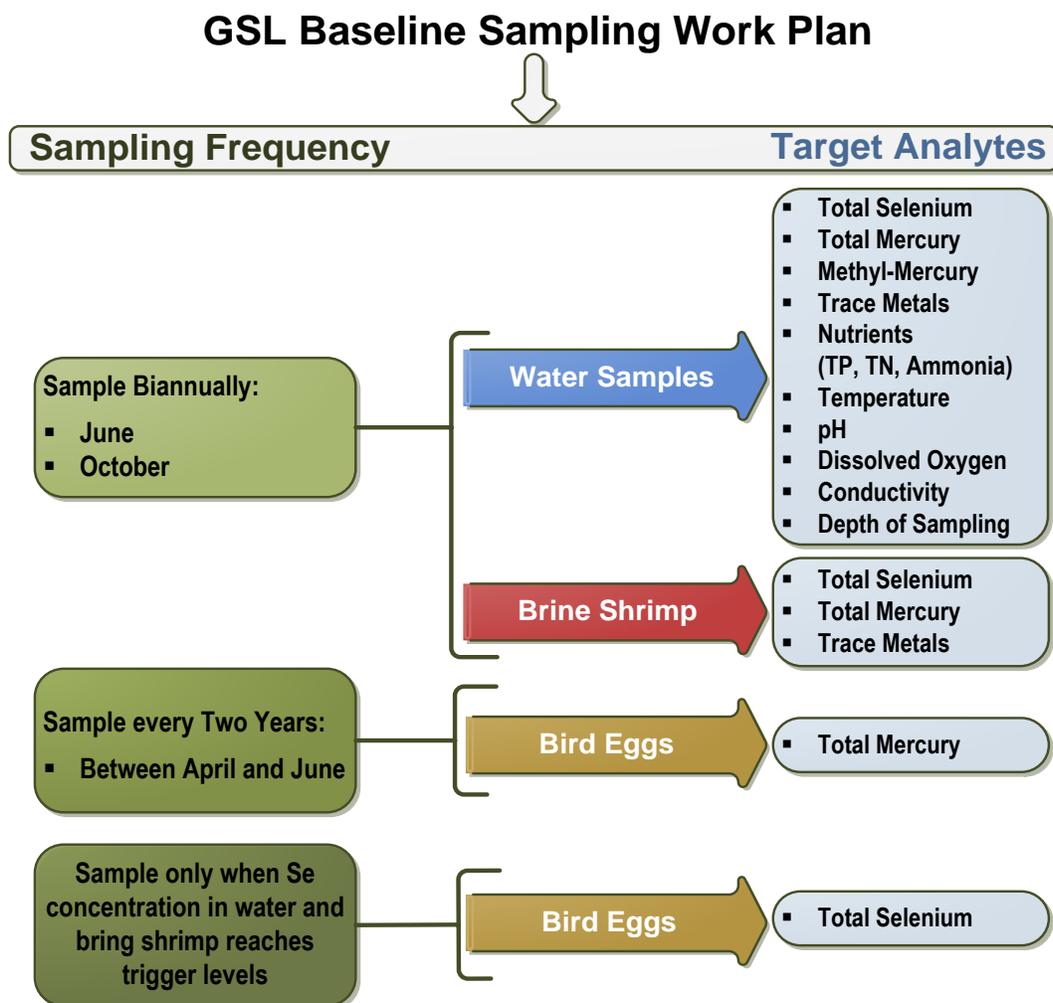

## 407 2.4 Sampling Approach

408 UDWQ intends that the baseline sampling program be adapted to address a variety of factors:

- 409  Newly developed methods
- 410  Availability of new research
- 411  New questions and issues
- 412  New water quality standards
- 413  New opportunities for collaboration in sample collection and analysis
- 414  Additional funding that may become available

415 The baseline sampling approach described in the following paragraphs is the minimum sampling and  
 416 monitoring required to meet UDWQ's current objectives and obligations for management of the open  
 417 waters of Great Salt Lake. While the approach to sampling on Great Salt Lake may change, it is  
 418 anticipated that the baseline sampling program will be incorporated into UDWQ's long-term  
 419 monitoring program of waters of the state. Figure 2-2 summarizes the work plan design for the  
 420 sampling plan.

421 FIGURE 2-2. GREAT SALT LAKE BASELINE SAMPLING WORK PLAN

422

423 **2.4.1 Water and Brine Shrimp**

424 Water and brine shrimp will be sampled and analyzed a minimum of twice per year using SOPs and  
 425 the QAPP. Samples will be collected once during the bird nesting season (April through June) and once  
 426 during the fall brine shrimp cyst harvest (September through November). Samples will be collected at  
 427 a minimum of 11 locations as shown in Figure 2-1 and Table 2-4. These locations were selected to  
 428 remain consistent with locations used in routine sample collection and research completed by the  
 429 UDWR and USGS (Naftz et al., 2008b). Additional locations may be added or samples collected  
 430 more frequently as resources are available, per the objectives of independent research studies or as  
 431 dictated by the selenium assessment framework described in Section 1.5. All samples will be collected  
 432 adjacent to or within the open waters of Great Salt Lake, Farmington Bay, and Bear River Bay so  
 433 samples are representative of contaminant exposure from the open waters of Great Salt Lake and

434 Farmington Bay. All results for tissue samples will be reported on a dry-weight basis, along with the  
435 percent moisture for each sample, insofar as adequate biomass can be collected.

436 The deep brine layer will be sampled for total and methyl-mercury, total selenium, total arsenic, total  
437 copper, cadmium, lead, and thallium, when it is present.

TABLE 2-4. SAMPLE POINTS AND COORDINATES

Sample Points	Target Bay	Approximate Coordinates*
1	Gilbert Bay	Latitude 40°46'07", Longitude 112°19'38"
2	Gilbert Bay	Latitude 40°53'56", Longitude 112°20'56"
3	Gilbert Bay	Latitude 41°02'23", Longitude 112°30'19"
4	Gilbert Bay	Latitude 41°04'22", Longitude 112°20'00"
5	Gilbert Bay	Latitude 41°06'44", Longitude 112°38'26"
6	Gilbert Bay	Latitude 41°06'37", Longitude 112°27'04"
7	Gilbert Bay	Latitude 41°11'16", Longitude 112°24'44"
8	Gilbert Bay/ Farmington Bay	Latitude 41°03'59", Longitude 112°13'47"
9	Farmington Bay	Latitude 41°02'24.36", Longitude 112°09'51.12"
10	Farmington Bay	Latitude 41°01'53", Longitude 112°08'23"
11	Bear River Bay	Latitude 41°19'38", Longitude 112°19'29"
12	Gunnison Bay	Latitude 41°15'19", Longitude 112°29'46"

**Note:**

\*(<http://wdr.water.usgs.gov/nwisgmap/?state=ut>)

438 Water samples and brine shrimp will be analyzed for the minimum analytes shown in Table 2-3.

439 Additional analytes may be included if included as part of the same analytical suite, as resources are  
440 available or per the objectives of independent research studies.

441 At a minimum, measurements documenting the temperature, pH, conductivity, dissolved oxygen, secchi  
442 depth, total water depth, and depth to deep brine layer will be made at the location where water  
443 and brine shrimp samples are collected.

#### 444 2.4.2 Bird Eggs

445 The eggs of shorebirds will be sampled to characterize the birds' exposure to metals present in the  
446 open waters of Great Salt Lake. Bird eggs will be sampled a minimum of once every 2 years to allow  
447 UDWQ to assess compliance with Great Salt Lake's tissue-based, numeric water quality standard for  
448 selenium and document levels of exposure to mercury. Per the recommendations of UDWQ's Selenium

449 Science Panel, American avocets and black-necked stilts foraging in the open waters of Great Salt  
450 Lake will be targeted initially (CH2M HILL, 2008). Bird eggs will be sampled and evaluated and  
451 tissues analyzed using SOPs and the QAPP.

452 A single egg will be collected from a minimum of five avocet nests and five stilt nests (preferably  
453 eight nests of each species) after the clutches are completed (total of 10 eggs). Each embryo will be  
454 checked for stage of development. Late-stage embryos will be examined for developmental  
455 abnormalities, including a determination of the embryo's position in the egg. Egg contents will then be  
456 analyzed for total selenium and total mercury and concentrations reported on a dry-weight basis,  
457 along with percent moisture of each sample.

458 The area considered for bird egg collection will be, at a minimum, Bridger Bay on north side of  
459 Antelope Island as shown in Figure 2-1. Additional locations may be added or additional eggs  
460 collected as allowed by the egg collection permit, as resources are available, per the objectives of  
461 independent research studies, or as dictated by the selenium assessment framework described in  
462 Section 2.5. All samples will be collected adjacent to or within the open waters of Great Salt Lake so  
463 samples are representative of contaminant exposure from the open waters of Great Salt Lake. All  
464 results for tissue samples will be reported on a dry-weight basis, along with the percent moisture for  
465 each sample, insofar as adequate biomass can be collected.

## 466 2.5 Selenium Assessment Framework

467 UDWQ's Selenium Science Panel discussed various alternatives for implementing a water quality  
468 standard for selenium in the open waters of Great Salt Lake. Given the uncertainties of the current  
469 understanding of selenium cycling in Great Salt Lake, the bioaccumulative nature of selenium, the need  
470 to incorporate both water-borne and tissue-based selenium concentrations, and the desire to  
471 proactively protect and manage the water quality of Great Salt Lake, the Science Panel developed a  
472 concept for a tiered approach to implementing the selenium water quality standard. The approach  
473 relies on the Bioaccumulation Model developed as part of the selenium research program to relate  
474 water, brine shrimp and bird egg concentrations (CH2M HILL, 2008).

475 Selenium monitoring completed as part of the Great Salt Lake baseline sampling program will follow  
476 this tiered approach. Figure 2-3 illustrates the framework of the tiered approach as adapted to  
477 incorporate the final selenium water quality standard. The intent of the tiered approach is for  
478 analytical results to be summarized by statistical measures, using a geometric mean, of lake-wide  
479 results for each medium that is sampled (e.g., geometric mean of analytical results for annual brine  
480 shrimp samples and from one nesting season for bird egg samples). UDWQ will use the defined

481 criteria in the selenium assessment framework and analytical results from the previous calendar year  
482 to determine the actions to be implemented for the following calendar year.

483 The tiered approach was developed to address the following objectives:

484  Monitor Great Salt Lake to assess trends in selenium concentrations and determine whether they  
485 are approaching or exceeding the water quality standard in eggs, using brine shrimp as  
486 indicators of whether the standard is likely to be exceeded in bird eggs

487  Address current uncertainty in modeled bioaccumulation relationships by validating expected  
488 bioaccumulation with new data for water and brine shrimp concentrations and, if appropriate,  
489 egg selenium and hatchability

490  Evaluate trigger selenium concentrations that initiate various monitoring, assessment, and  
491 management actions identified in the assessment framework

492  Evaluate the lake with respect to the numeric water quality standard for selenium

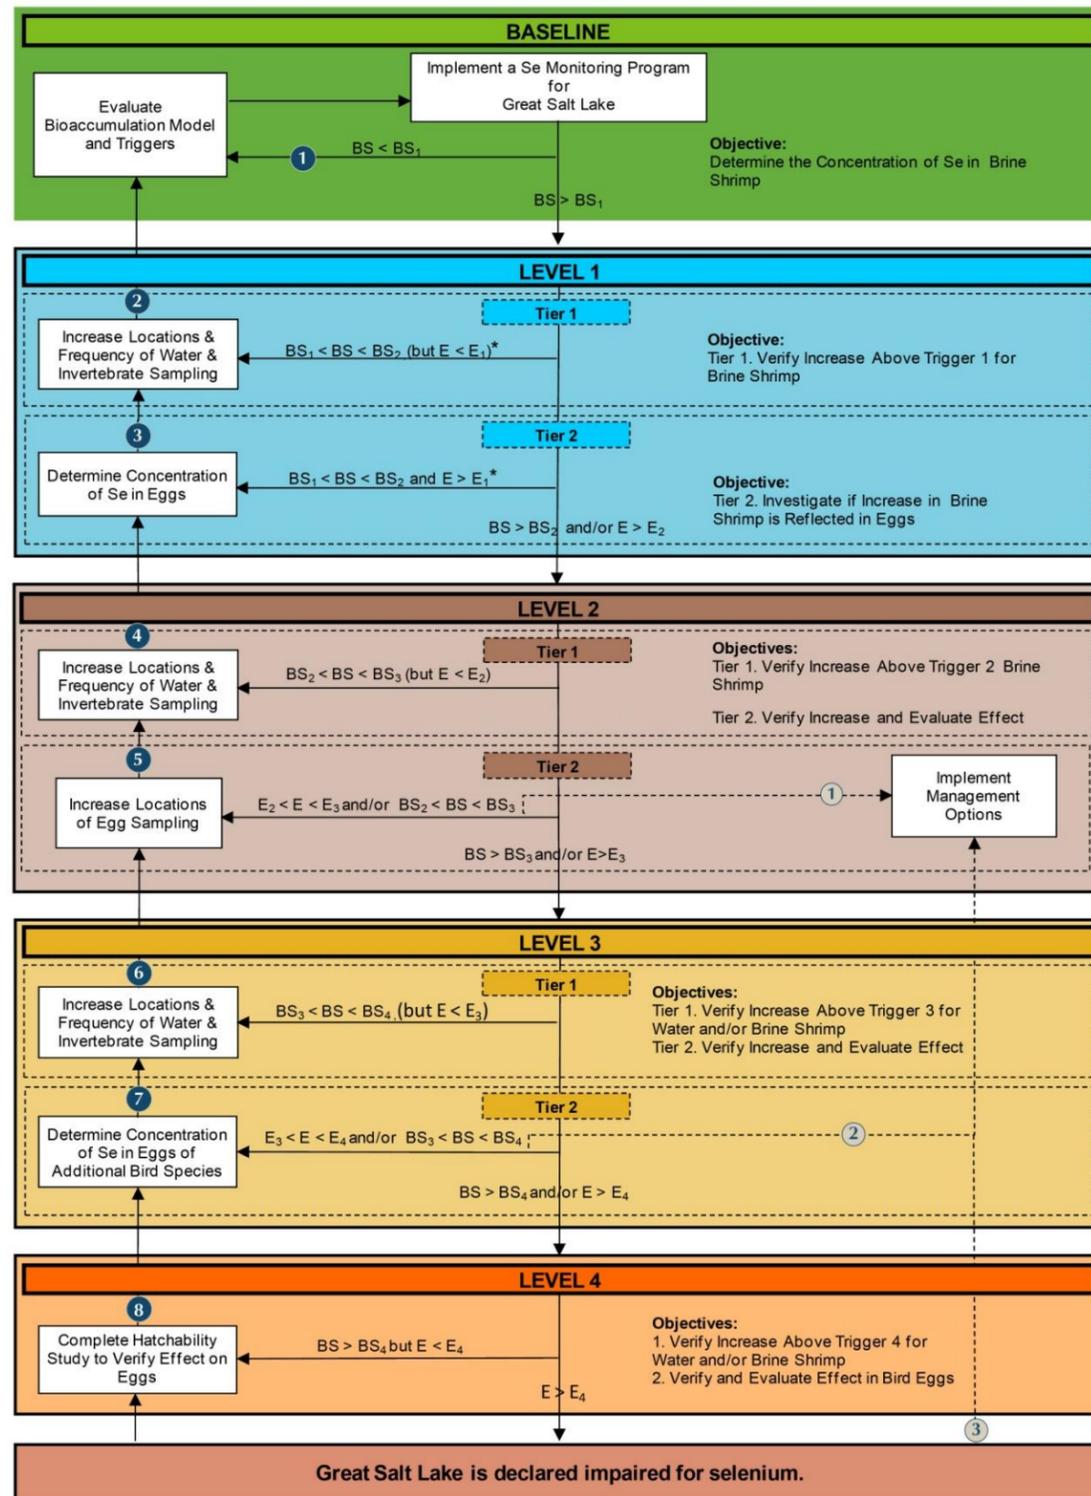

493  Initiate management actions based on applicable selenium triggers

494 The approach implements various trigger concentrations for brine shrimp and egg selenium that  
495 increase monitoring levels and management options if and when actual selenium concentrations  
496 increase.

497 Use of this approach will allow UDWQ to continually assess and improve on the relationships included  
498 in the Bioaccumulation Model and the trigger levels included in the approach (see Table 2-5). The  
499 increasing levels of monitoring and implementation of management options, when necessary, are  
500 intended to provide a more robust and defensible dataset to confirm an apparent upward trend in  
501 selenium concentrations, as well as provide a means to assess efforts to mitigate the upward trend, if  
502 one occurs.

503 Table 2-5 summarizes the trigger bird egg concentrations included in the final tissue-based, numeric  
504 water quality standard (UAC R317-2A-14) and the associated brine shrimp concentrations estimated  
505 by the Bioaccumulation Model (Version 5.0). Tables 2-6 and 2-7 summarize recommended changes to  
506 the baseline sampling program and management actions corresponding to observed changes in  
507 selenium concentrations in brine shrimp and bird eggs. Tables 2-5, 2-6, and 2-7 will be used in  
508 conjunction with Figure 2-3.

509 FIGURE 2-3. ASSESSMENT FRAMEWORK FOR SELENIUM IN GREAT SALT LAKE

NOTE: If GSL bird eggs were not sampled in previous calendar year, utilize the geomean of egg Se concentrations from prior 2 years.

TABLE 2-5. TRIGGER LEVELS CORRESPONDING TO SELENIUM ASSESSMENT FRAMEWORK FOR OPEN WATERS OF GREAT SALT LAKE

Matrix	Units	Trigger 1 Concentration	Trigger 2 Concentration	Trigger 3 Concentration	Trigger 4 Concentration
Brine Shrimp (BS)	ppm (dw)	5.3	7.0	10.8	13.7
Egg (E)	ppm (dw)	5.0	6.4	9.8	12.5

**Notes:**

dw = Dry Weight

ppm = Part per Million

Egg values obtained from UAC R317-2-14, values for water and brine shrimp back calculated using Bioaccumulation Model version 5.0 (CH2M HILL, 2008). See Figure 2-3 for the Selenium Assessment Framework.

TABLE 2-6. DESCRIPTION OF SAMPLING ACTIVITIES REQUIRED BY SELENIUM ASSESSMENT FRAMEWORK FOR OPEN WATERS OF GREAT SALT LAKE

No.	Description of Sampling Activities
1	Sample water and brine shrimp at 11 locations semiannually
2	Increase sampling of water and brine shrimp to 11 locations on quarterly basis
3	Add sampling of bird eggs at one location for two shorebird species on annual basis, sample water and brine shrimp at 11 locations on quarterly basis
4	Increase sampling of water and brine shrimp to 16 locations on quarterly basis, sample bird eggs at one location for two shorebird species on annual basis
5	Increase sampling of eggs to two locations for two shorebird species on annual basis, sample water and brine shrimp at 16 locations on quarterly basis
6	Increase sampling of water and brine shrimp to 16 locations on monthly basis, sample bird eggs at two locations for two shorebird species on annual basis
7	Increase sampling of eggs to include two shorebird species and gulls, each at two locations on annual basis; sample water and brine shrimp at 16 locations on monthly basis
8	Complete a hatchability study on two shorebird species and gulls, sampling of eggs to include two shorebird species and gulls, each at two locations on annual basis; sample water and brine shrimp at 16 locations on monthly basis

TABLE 2-7. DESCRIPTION OF MANAGEMENT ACTIONS REQUIRED BY SELENIUM ASSESSMENT FRAMEWORK FOR OPEN WATERS OF GREAT SALT LAKE

No.	Description of Management Action
1	Initiation of a Level II Antidegradation review by the State for all discharge permit renewals or new discharge permits for Great Salt Lake; the Level II Antidegradation review may include an analysis of loading reductions
2	Initiation of preliminary TMDL studies to evaluate selenium loading sources
3	Declare impairment. Formalize and implement TMDL

**Notes:**

TMDL= Total Maximum Daily Load

Management actions obtained from UAC R317-2-14.

## 511 **2.6 Sampling Procedures/Methodology**

512 All sampling activities required by the baseline sampling program will follow the methods described in  
513 SOPs defined by UDWQ. Before going out for field sampling, a checklist of all routine material and  
514 equipment needed during sampling will be prepared. A separate list will be created for specialized  
515 sampling equipment, if required. Specialized sampling may include materials and equipment for clean  
516 sampling methods. In addition, safety gear, such as life jackets and safety vests, as well as  
517 appropriate clothing and shoes, will be worn as required during sampling.

### 518 **2.6.1 Health and Safety**

519 A site hazard analysis and Health and Safety Plan (HSP) will be prepared before completing  
520 sampling activities as required by UDWQ. While possible hazards include accessing the lake and  
521 nesting sites, the use of motorized vehicles, possible extreme weather (exposure to rough water, cold  
522 water, lightning, sun, temperatures, etc.), and working in and around moving water, the field sampling  
523 team will assess all hazards and address them in the HSP before going to the field. All staff involved  
524 with field sampling activities will follow the HSP.

## 525 **2.7 Quality Assurance Project Plan**

526 All sampling and analytical activities required by the baseline sampling program will follow the  
527 requirements described in the QAPP defined by UDWQ.

## 528 **2.8 Reporting**

529 Sampling began in 2011 and will continue on an annual basis. Detailed field and laboratory data,  
530 analysis, and summary of results will be presented in an annual report. This report is due by March 1  
531 following the end of the calendar year when samples were collected.

532 UDWQ will keep project files including electronic copies of analytical data, field notes, data sheets  
533 and journals, photographs, analyses, and reports for a period of at least 5 years after the year of  
534 data collection.

### 535 III. STUDIES TO IMPROVE BASELINE SAMPLING PLAN FOR THE OPEN 536 WATERS OF GREAT SALT LAKE

537 The baseline sampling plan presented in Section II does not represent the final word in what Great  
538 Salt Lake research needs and target contaminants are—or even the sampling methods that should be  
539 used. It is a starting point that will enable UDWQ to begin the development of a long-term database  
540 describing the condition of Great Salt Lake. The baseline sampling plan is intended to be adapted  
541 and revised as the knowledge and understanding of Great Salt Lake ecosystem processes improves.  
542 This section provides a summary of studies UDWQ will complete to inform, build on, and advance the  
543 baseline sampling plan.

#### 544 3.1 Introduction

545 The unique and dynamic nature of Great Salt Lake is well documented in the literature, especially as  
546 related to the lake's salinity and history of management and modifications. Before the construction of  
547 the railroad causeway across the central part of Great Salt Lake in 1959, the salinity and chemistry  
548 of the water is thought to have been well-mixed throughout the lake ([www.wildlife.utah.gov/gsl](http://www.wildlife.utah.gov/gsl)).  
549 After the causeway's completion, the main body of the lake was physically divided into a north arm  
550 and a south arm. As a result of the predominance of freshwater inputs in the south, the north arm of  
551 the lake became much more saline and the south arm became density stratified, with a deep brine  
552 layer variably underlying the mixed, less-saline surface water.

*The objective of these studies is  
to improve the goals, objectives,  
and sampling and analytical  
methods described in the  
baseline sampling plan.*

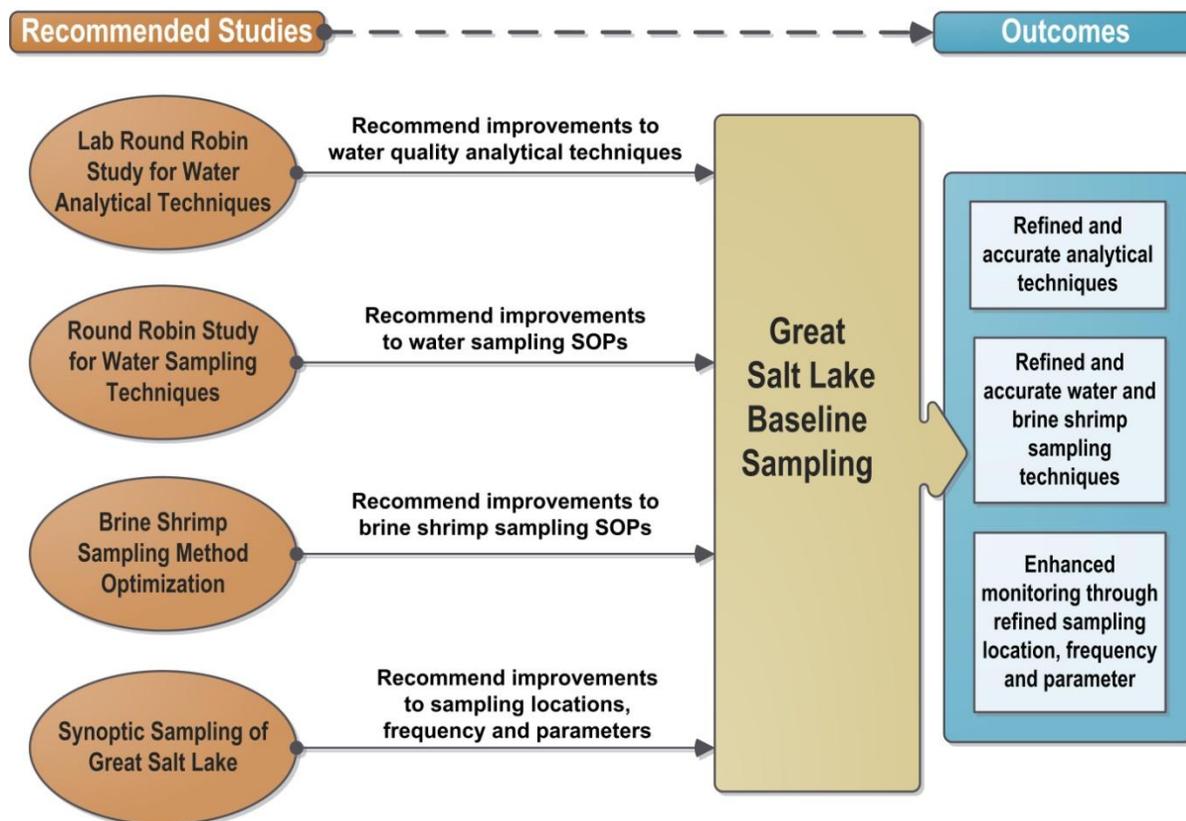

553 Salinity varies both spatially and temporally within  
554 the lake and is affected by lake levels, seasonal  
555 fresh water inputs, and dikes and causeways that  
556 divide the lake. It ranges from 0.5 to 6 percent in the  
557 Farmington Bay to 25 percent or higher in Gunnison  
558 Bay (North Arm). The main body of the lake, also  
559 known as the Gilbert Bay (South Arm) has salinity  
560 ranging from 6 to 15 percent (USGS, 2009). In

561 addition, the lake water is alkaline with an average pH of 8.6, and is stratified in some locations with  
562 a sharp chemocline occurring at approximately middepth. The water column at and below this  
563 chemocline (i.e., the deep brine layer) is anaerobic.

564 This varied water chemistry and complex matrix drives the fate and transport of contaminants in the  
565 lake and has an effect on sampling and analytical procedures, possibly making standard methods

566 inappropriate. There is a need to understand these effects to make sampling and analysis of water  
 567 quality parameters and other variables more reliable. The following section identifies studies UDWQ  
 568 will complete with the objective of improving the goals, objectives, and sampling and analytical  
 569 methods described in the baseline sampling plan. Figure 3-1 illustrates how the studies will help inform  
 570 and advance the baseline sampling plan. Prioritization of these studies is detailed in Section 1.5.

571 **FIGURE 3-1. SCHEMATIC REPRESENTATION OF HOW THE STUDIES WILL INFORM AND ADVANCE THE GREAT SALT LAKE BASELINE**  
 572 **SAMPLING PLAN**

573

## 574 **3.2 A Laboratory Round Robin Study for Great Salt Lake Water** 575 **Quality Analytical Techniques**

### 576 **3.2.1 Problem Statement**

577 Due to the complex geochemical properties of Great Salt Lake water, sample preservation, storage,  
 578 and preparation, as well as accurate analysis of target analytes, can be challenging. Standard  
 579 analytical methods may fail to accurately measure certain analytes due to interferences from high  
 580 concentrations of total dissolved solids and other matrix effects. For example, a round robin study  
 581 conducted by UDWQ for the assessment of selenium in Great Salt Lake found selenium concentrations  
 582 to vary widely among different analytical techniques used (Moellmer et al., 2006). Similarly,

583 USGS has found that it needed to alter its analytical methods to accurately assess nutrients in Great  
584 Salt Lake (personal communication, Harold Ardourel, National Water Quality Laboratory, USGS). It is  
585 thus prudent to conduct a laboratory round robin study for key target analytes in Great Salt Lake  
586 water as part of implementing a long-term monitoring program. This will help identify, develop, and  
587 validate reliable analytical methods for the lake.

### 588 **3.2.2 Study Objectives**

589 This study will focus on identifying, validating, and optimizing laboratory analytical methods and will  
590 provide answers to the following questions:

- 591  What analytical methods should be used for analysis of key contaminants of concern in Great Salt  
592 Lake?
- 593  Which laboratories are best suited for analyzing these samples?
- 594  What quality assurance procedures should be followed for accurate sample handling and  
595 analysis?

596 Recommendations from this study will help standardize analytical methods among different agencies  
597 monitoring and studying water quality and the ecosystem of the Great Salt Lake.

### 598 **3.2.3 Management Objectives**

599 This study will address UDWQ's responsibility to monitor Great Salt Lake. It will help ensure that data  
600 collected is relevant, defensible, and useful for determining long-term water quality trends,  
601 quantifying water quality problems, establishing water quality goals, assessing beneficial use support,  
602 and determining the effectiveness of pollution control programs.

### 603 **3.2.4 Approach**

604 This study will be conducted during the early phase of the Great Salt Lake baseline monitoring  
605 program and will focus on key contaminants that are of high priority and pose the greatest risk to the  
606 lake's ecosystem. Great Salt Lake's water chemistry varies widely; salinity ranges spatially from 3 to  
607 20 percent and significant differences can be found between the upper and deep brine layers.  
608 Ideally, the round robin will capture a range of conditions to provide assurances that the methods  
609 used for long-term monitoring apply at all conditions. However, such an effort is likely cost prohibitive.  
610 Alternatively, samples could be collected from a location representing a typical salinity condition of  
611 Great Salt Lake. UDWQ could begin with samples from one location to determine the best methods  
612 and laboratory and then complete a second round robin to determine the applicability across the  
613 range of Great Salt Lake water quality conditions, as well as water depths. Water samples will be

614 collected per UDWQ's SOP and will be shipped to an independent lab for replication and spiking.  
615 The independent lab will replicate and/or spike each sample with known concentrations of target  
616 analytes before shipping them to participating laboratories for the round robin study. UDWQ will  
617 determine at a later stage whether or not the independent lab can participate in the round robin  
618 study.

619 During water sample collection, essential water quality parameters, such as dissolved oxygen  
620 concentration, pH, turbidity, density, temperature, depth, and salinity, will be measured and recorded.

### 621 **3.2.5 Variables to be Assessed**

622 The laboratory round robin study will be conducted for the following analytes in water samples:

- 623  Total and methyl-mercury
- 624  Trace metals/metalloids—total selenium, total arsenic, total copper, total cadmium, total lead,  
625 and total thallium
- 626  Nutrients—total nitrogen, total phosphorus, ammonia-N, and nitrate+nitrite-N

627 While collecting water samples, field measurements of salinity, dissolved oxygen, pH, temperature,  
628 and turbidity will be conducted using a calibrated field multimeter.

629 The round robin study will include the following analytical methods, though this may be adjusted  
630 based on other valid findings of other reliable analytical methods:

- 631  Total mercury—EPA Method 1631, Revision E, using oxidation, purge and trap and cold vapor  
632 atomic fluorescence spectrometry or equivalent
- 633  Methyl-mercury—EPA Method 1630 by distillation, aqueous ethylation, purge and trap and cold  
634 vapor atomic fluorescence spectrometry and USGS methods by aqueous phase ethylation,  
635 followed by gas chromatographic separation with cold vapor atomic fluorescence detection
- 636  Total selenium—Hydride generation – atomic absorption, hydride generation – atomic  
637 fluorescence spectrometer, dynamic reaction cell (DRC) inductively coupled plasma – mass  
638 spectrometry (ICP-MS), and reductive precipitation with ICP-MS
- 639  Trace metals—EPA Method 1640, DRC ICP-MS, collision cell ICP-MS, and reductive precipitation  
640 with ICP-MS
- 641  Nutrients—Alkaline persulfate digestion methods for simultaneous determination of dissolved and  
642 total nitrogen and phosphorus, low-level phosphorus determination by EPA persulfate digestion  
643 (Method 365.1), or other USGS-recommended methods

### 644 **3.2.6 Participating Laboratories**

645 Laboratories to be included in the round robin study will be selected for their ability to comply with  
646 the QAPP and have National Environmental Laboratory Accreditation Certification with the State of  
647 Utah. Those that comply with QAPP protocol without state certification will be asked to apply for  
648 certification before work is initiated.

### 649 **3.2.7 Spatial Boundaries**

650 One sample will be collected from Great Salt Lake in the Gilbert Bay, representing a typical salinity  
651 condition of the lake.

## 652 **3.3 Round Robin Study for Water Sampling Techniques in the** 653 **Great Salt Lake**

### 654 **3.3.1 Problem Statement**

655 Several local, state, and federal agencies are currently sampling water in Great Salt Lake for  
656 purposes of monitoring trends in water quality and understanding impacts to the ecosystem and to the  
657 industries that depend on resources from the Great Salt Lake. Sampling has historically been done by  
658 different investigators with different study objectives. Further, the complex geochemistry of Great Salt  
659 Lake water may preclude the use of certain equipment and require unique calibration methods,  
660 preservation methods, etc. These differences and issues may potentially bring the accuracy of water  
661 quality data into question. Thus, it is important to standardize sampling techniques, sample  
662 preservation, and instrument calibrations methods among all agencies. It is the objective of this study  
663 to facilitate a discussion among current investigators and complete a round robin study of sampling  
664 methods as required to determine the best available method for use by agencies in monitoring the  
665 water quality of Great Salt Lake. This will facilitate more efficient data comparison and use to  
666 understand and predict the lake water quality better.

### 667 **3.3.2 Study Objectives**

668 This study will provide answers to the following questions:

- 669  What methods/equipment should be used to collect water samples from the upper and deep  
670 brine layer of Great Salt Lake?
- 671  Do grab samples collected from a certain depth adequately represent lake water quality versus  
672 composite samples collected across water depth?
- 673  At what depth should water samples be collected from the upper and deep brine layer?

674  What field measurement equipment, calibration methods, and measuring procedures should be  
675 followed for dissolved oxygen, salinity, pH, clarity, and temperature measurement in the lake?

676  What quality assurance procedures should be followed for accurate sample collection,  
677 preservation, storage, and handling?

### 678 **3.3.3 Management Objectives**

679 This study will address UDWQ's responsibility to monitor Great Salt Lake. It will help ensure that data  
680 collected is relevant, defensible, and useful for determining long-term water quality trends,  
681 quantifying water quality problems, establishing water quality goals, assessing beneficial use support,  
682 and determining the effectiveness of pollution control programs.

### 683 **3.3.4 Approach**

684 UDWQ will facilitate a meeting of current Great Salt Lake investigators and interested agencies to  
685 discuss current sampling practices. The discussion will focus on defining current methods and equipment  
686 that are used, identifying when and where those methods and equipment are most beneficial and the  
687 benefits and risks of each, and achieving consensus on standardization of methods and equipment to  
688 be used for sampling Great Salt Lake water. The outcome of the meeting(s) will be SOPs for  
689 monitoring Great Salt Lake water quality that are accepted by participating agencies. For any  
690 method or equipment that merits further investigation and comparison, UDWQ will facilitate a round  
691 robin study, in partnership with other agencies, to determine the preferred and recommended method  
692 for monitoring Great Salt Lake water quality.

693 Information gathered from this study will inform and improve upon existing water sampling SOPs and  
694 standardize them for use among all agencies.

### 695 **3.3.5 Variables to be Assessed**

696 At a minimum, the following field water quality parameters and sampling methods will be addressed:

697  Dissolved oxygen measurement and instrument calibration

698  pH measurement and instrument calibration

699  Temperature measurement and instrument calibration

700  Clarity measurement and instrument calibration

701  Sampling depth (grab samples versus samples composited over depths and standardized  
702 sampling depth for upper and deep brine layers)

703  Sampling equipment

### 704 **3.3.6 Spatial Boundaries**

705 In the case of a field round robin, water samples will be collected and field measurements conducted  
706 at locations representing a typical salinity condition of Great Salt Lake in the Gilbert Bay.

## 707 **3.4 Brine Shrimp Sampling Method Optimization**

### 708 **3.4.1 Problem Statement**

709 Brine shrimp are a critical element in the Great Salt Lake ecosystem. They serve as food to the millions  
710 of birds that nest at and migrate through the lake every year and contribute significantly to Utah's  
711 economy through their hard-walled eggs (cysts) that are commercially harvested and used worldwide  
712 in the aquaculture and ornamental fish industries. The lake is an internationally renowned source for  
713 high-quality cysts. The total annual economic effect of Great Salt Lake's brine shrimp industry was  
714 recently estimated to be almost \$56 million (Bioeconomics, Inc., 2012). Thus, accurate and consistent  
715 methods for monitoring of brine shrimp are needed to assess whether Great Salt Lake is supporting its  
716 beneficial uses, to understand the potential impact of trace metals/metalloids (especially selenium and  
717 mercury) on brine shrimp, and to help evaluate the transfer of these contaminants through trophic  
718 compartments of the Great Salt Lake food web.

719 Between 2006 and 2008, UDWQ coordinated studies to assess the impacts of selenium on the Great  
720 Salt Lake ecosystem. As a part of that study, selenium concentrations were measured in brine shrimp to  
721 assess temporal and spatial variations (Marden, 2008). The study resulted in very useful data but  
722 highlighted some uncertainties that could be introduced depending on the brine shrimp sampling  
723 procedure that is used. For example, it was not clear if a better representation of brine shrimp  
724 exposure to contaminants in the lake was obtained when brine shrimp were collected via a vertical  
725 haul using a plankton net or via a horizontal tow using a net of proper mesh size behind a boat. The  
726 UDWR has consistently used the vertical haul method for its brine shrimp population studies; therefore,  
727 using this method could present opportunities for collaboration if it is deemed to be the most  
728 appropriate for evaluating potential contaminants. Another example pertains to how the brine shrimp  
729 are handled after collection. Selenium concentrations in brine shrimp samples were found to be lower  
730 when rinsed with distilled water and sorted out by age class from other zooplanktons compared with  
731 unrinsed and unsorted samples (personal communication, Brad Marden). This study aims to isolate the  
732 variables to determine the most appropriate method for sampling brine shrimp from Great Salt Lake.

### 733 3.4.2 Study Objective

734 This study will focus on providing recommendations to finalizing an SOP for sampling brine shrimp. The  
735 study will work to answer the following questions:

- 736  Which method, vertical haul, or horizontal tow  
737 provides the best representation of exposure of brine  
738 shrimp to contaminants in Great Salt Lake?
- 739  Do concentrations of key contaminants in brine shrimp  
740 vary with depth and at what depth should brine  
741 shrimp be sampled?
- 742  How should brine shrimp samples be processed before  
743 shipping for analysis (i.e., sorting, rinsing, preservation,  
744 etc.)?
- 745  The UDWR collects brine shrimp samples to assess  
746 population dynamics. Can a sample that has been  
747 processed for population estimation be analyzed for  
748 contaminants and still be representative of Great Salt  
749 Lake water quality conditions?

FIGURE 3-2. BRAD MARDEN SAMPLING BRINE SHRIMP FROM GREAT SALT LAKE

### 750 3.4.3 Management Objectives

751 This study will address UDWQ's responsibility to monitor  
752 and assess the beneficial uses of Great Salt Lake. It will help ensure that data collected is relevant,  
753 defensible, and useful for determining long term water quality trends, quantifying water quality  
754 problems, establishing water quality goals, assessing beneficial use support, and determining the  
755 effectiveness of pollution control programs.

### 756 3.4.4 Approach

757 This section provides a general approach. This may be adjusted to accommodate other reliable  
758 sampling and sample handling methods being implemented by agencies that are currently studying  
759 brine shrimp in Great Salt Lake.

760 Simultaneous sampling will be conducted at the same locations and time using different vertical and  
761 horizontal brine shrimp collection methods. Additional methods, such as an oblique tow, could also be  
762 investigated (i.e., start at a bottom depth with boat moving forward; steadily tow net at angle to the  
763 surface). Vertical tows will encompass the entire water column, with or without the deep brine layer, to  
764 within a net's length of the bottom (to not stir up bottom sediment into the net). The samples will then  
765 be homogenously replicated into various batches and will be subjected to the following:

- 766  Rinse sample using distilled water, sort and analyze for contaminants
- 767  Rinse sample using filtered lake water, sort and analyze for contamination
- 768  Rinse sample using distilled water and analyze for contamination without sorting
- 769  Rinse sample using lake water and analyze for contamination without sorting
- 770  Analyze for contaminants without rinsing or sorting samples
- 771 Sorting will consist of hand removal of all debris and non-brine shrimp organisms from the samples.

#### 772 **3.4.5 Variables to be Assessed**

773 All brine shrimp samples will be analyzed for total selenium and total mercury.

#### 774 **3.4.6 Spatial Boundaries**

775 Any three locations may be selected from Figure 2-1 in Section II within the Gilbert Bay of Great Salt  
776 Lake.

#### 777 **3.4.7 Temporal Boundaries**

778 Temporal boundaries are not applicable to this study.

### 779 **3.5 Synoptic Sampling of Great Salt Lake**

#### 780 **3.5.1 Introduction**

781 The lake is both spatially and temporally dynamic in nature. Its unique biogeochemistry and  
782 hydrology create an environment that is complex, difficult to develop water quality standards for,  
783 difficult to assess, and may change both spatially and temporally. For UDWQ to fulfill its  
784 responsibilities, it is essential to characterize and evaluate the lake's water quality for known  
785 contaminants of concern as well as emerging contaminants as listed by the EPA through an intensive  
786 short-term synoptic sampling investigation. It is important to verify assumptions regarding sampling  
787 locations and seasons. While the baseline sampling plan will monitor trends for certain contaminants,  
788 this study will provide a benchmark for many other possible contaminants and confirm sampling  
789 locations/seasons. It will establish an important benchmark of the lake's current water quality  
790 condition, help in optimizing the long-term baseline sampling plan, and determine if and how water  
791 quality changes over time.

### 792 3.5.2 Study Objectives

793 This study will focus on developing recommendations to improve the baseline sampling plan by  
794 providing answers to the following questions:

795  What are the concentrations of potential contaminants not included in the baseline sampling plan  
796 in the water and sediment of Great Salt Lake?

797  Are contaminants of emerging concern present in Great Salt Lake?

798  How do concentrations of potential contaminants vary spatially and temporally?

799  What are the optimum sampling times (i.e., seasons) and locations to obtain a good representation  
800 of the lake's water quality condition?

801  How do the concentrations of some key contaminants vary with lake flows, lake levels, and lake  
802 chemistry (e.g., salinity, pH, temperature, dissolved oxygen, etc.)?

803  How do concentrations of this wider list of potential concentrations change over the long term?

### 804 3.5.3 Management Objectives

805 This study will address UDWQ's responsibility to monitor and assess the beneficial uses of Great Salt  
806 Lake. It will also inform and help UDWQ to prioritize the development of water quality standards for  
807 Great Salt Lake. It will help ensure that data collected is relevant, defensible, and useful for  
808 determining long-term water quality trends, quantifying water quality problems, establishing water  
809 quality goals, assessing beneficial use support, and determining the effectiveness of pollution control  
810 programs.

### 811 3.5.4 Approach

812 This study will be conducted over 1 year with monthly or bimonthly sampling events to accommodate  
813 seasonal effects and varying lake levels. Also, the study will be repeated every 5 years to capture  
814 potential changes in lake's water quality and to update or recommend changes in the baseline  
815 monitoring program. Collocated water, sediment, and brine shrimp samples will be collected. All  
816 sampling and analysis will be completed per the most current and accepted SOPs and QAPP (these  
817 documents may be updated per the recommended round robin studies discussed previously). It should  
818 be noted that a round robin cannot be conducted on all measured variables and characteristics.  
819 However, results obtained and lessons learned from existing round robin studies will be referenced as  
820 needed.

### 821 **3.5.5 Variables and Characteristics to be Measured**

- 822  Physicochemical characteristics in water—Flow, depth, pH, temperature, specific conductance,  
823 secchi disk depth, turbidity, and total suspended solids
- 824  Chemical characteristics in water—Dissolved oxygen, salinity, total dissolved solids, biochemical  
825 oxygen demand, and total organic carbon in water
- 826  Biological characteristics in water—Fecal coliform, chlorophyll  $\alpha$ , phytoplankton identification and  
827 enumeration, and zooplankton identification and enumeration (including brine shrimp)
- 828  Trace elements in collocated water, sediment and brine shrimp—Aluminum, antimony, arsenic,  
829 barium, boron, cadmium, calcium, cobalt, copper, chromium, hexavalent chromium, gold, iron, lead,  
830 lithium, magnesium, manganese, total mercury, methyl mercury, molybdenum, nickel, palladium,  
831 potassium, platinum, selenium, silicon, silver, sodium, tin, titanium, thallium, vanadium, and zinc
- 832  Nutrients in water and sediments—Ammonia-N, total and dissolved phosphorus, total nitrogen,  
833 and nitrate+nitrite-N
- 834  Emerging contaminants in water, sediments, and brine shrimp—Pharmaceutical and personal care  
835 products, endocrine disrupters, and persistent organic pollutants. UDWQ will facilitate a  
836 committee to discuss options and target those contaminants of most concern for Great Salt Lake.

### 837 **3.5.6 Spatial Boundaries**

838 The study area will include the entire lake, including Gilbert Bay (South Arm), Carrington Bay,  
839 Gunnison Bay (North Arm), Ogden Bay, Farmington Bay, Bear River Bay, and Willard Spur. The  
840 UDWR's standard lake-wide sampling locations be used for this study. These may be adjusted based  
841 on accessibility, depth of water, weather constraints, etc.

### 842 **3.5.7 Temporal Boundaries**

843 Sample collection will be conducted every month during 1 year and will be repeated every 5 years.

## 844 **IV. RESEARCH PLAN FOR GREAT SALT LAKE**

845 Great Salt Lake's complex and unique characteristics make establishing water quality standards,  
846 monitoring its water quality, and assessing its beneficial use support extremely challenging. It is  
847 UDWQ's objective to improve on the available dataset, existing water quality standards, and  
848 methods for assessing Great Salt Lake. This section outlines a systematic and collaborative approach  
849 to research that will enable UDWQ to proactively fulfill its responsibilities under the CWA.

## 850 **4.1 Introduction**

### 851 **4.1.1 Objective**

852 The research identified in this section will be completed as part of UDWQ’s strategy to protect the  
853 beneficial uses of Great Salt Lake and proactively fulfill its responsibilities under the Clean Water  
854 Act. Each study is designed to address UDWQ’s specific management objectives and responsibilities in  
855 collaboration with its partners. These include supporting the development of water quality standards,  
856 monitoring, UPDES permitting, and assessment programs.

#### 857 **4.1.2 Opportunity for Collaboration**

858 As discussed in previous sections, Great Salt Lake provides innumerable opportunities for researchers  
859 to investigate the unique and complex interactions and processes that regulate this dynamic resource.  
860 The challenge is to review these opportunities (i.e., questions that could be and need to be answered)  
861 and focus efforts and resources on areas most critical for UDWQ to fulfill its responsibilities. Further,  
862 there are many resources in Great Salt Lake (e.g., minerals, land, wildlife, recreation, water resources,  
863 endangered species, water quality, etc.)—all are inextricably linked but are managed by different  
864 agencies. Thus, while this section focuses on the identification of research to support UDWQ’s  
865 management of Great Salt Lake’s water quality, it is important to note that many of these efforts  
866 overlap and help address other Great Salt Lake resources as well. A collaborative approach to  
867 planning, conducting, and reviewing these research needs is critical to efficiently and effectively  
868 managing all of the resources of Great Salt Lake.

869 It is UDWQ’s intent that the research studies identified in this section are conducted in collaboration  
870 and coordination with the other state and federal agencies responsible for Great Salt Lake’s  
871 resources. UDWQ has already engaged with the Great Salt Lake Advisory Council and other  
872 agencies to become an active partner and participant in their planning and research activities and  
873 they, in turn, in UDWQ’s investigations (e.g., Great Salt Lake Comprehensive Management Plan, the  
874 UDWR’s Technical Advisory Group, UDWQ’s Willard Spur Steering Committee and Science Panel,  
875 Great Salt Lake Water Monitoring Council, etc.). Ongoing coordination and support among agencies  
876 in this research is critical for leveraging resources and focusing efforts to achieve management  
877 objectives.

### 878 4.1.3 Section Organization

879 There are numerous questions that have been posed by researchers over the years as they have  
880 sought to understand the geochemistry and ecology of Great Salt Lake. UDWQ has reviewed a wide  
881 array of literature and attended numerous meetings facilitated by Great Salt Lake researchers and

***The objective of these studies is to support:*** 882

- 883 1) *The development of water quality standards* 884
- 885 2) *Monitoring of Great Salt Lake waters* 886
- 887 3) *The assessment of Great Salt Lake's beneficial uses and enable UDWQ to proactively fulfill its responsibilities under the CWA* 888

889 stakeholders (from 2004 to present) to  
890 listen to and identify those issues that  
appear to be of most importance to Great  
Salt Lake water quality. A detailed list of  
research questions, provided in Appendix  
A, was compiled to summarize many of the  
issues identified for Great Salt Lake. This  
list, along with research questions defined  
as part of UDWQ's efforts in Willard Spur

891 and the development of a Great Salt Lake wetland assessment framework, were consolidated into a  
892 systematic research framework to leverage synergies between efforts and more efficiently focus  
893 available resources. While work is generally divided to address (1) open water and (2) wetland  
894 habitats, these habitats overlap and provide opportunities for collaboration.

895 Figure 4-1 provides a schematic summary of the questions deemed most critical toward enabling  
896 UDWQ to proactively fulfill its responsibilities. Studies were grouped into the following three research  
897 areas (with corresponding section numbers in this document):

898 4.2 Common Need

899 4.2.1 Data Repository

900 4.3 Open Water Research

901 4.3.1 Great Salt Lake Water and Sediment

902 4.3.2 Great Salt Lake Lower Food Chain

903 4.3.3 Great Salt Lake Upper Food Chain

904 4.4 Wetlands Research

905 4.4.1 Wetland Assessment Framework

906 4.4.2 Willard Spur

907 4.4.3 Additional Wetlands Research Needs

908 Refer to Section I for a prioritization of these studies. A detailed discussion of research needs follows.

909 FIGURE 4-1. RESEARCH QUESTIONS TO SUPPORT THE DEVELOPMENT OF STANDARDS FOR AND ASSESSMENT OF GREAT SALT LAKE

Components of Great Salt Lake Ecosystem		Research Questions
Upper Food Chain	<p>Birds</p>	<ul style="list-style-type: none"> <li>▪ 4.3.3.1 How does the avian population use GSL?</li> <li>▪ 4.3.3.2 Develop trophic transfer model for upper food chain</li> <li>▪ 4.3.3.3 How do selenium and mercury affect GSL avian population?</li> </ul>
Lower Food Chain	<p>Brine Shrimp, Brine Fly (All Life Stages)</p>	<ul style="list-style-type: none"> <li>▪ 4.3.2.1 What are the effects of salinity on planktonic and benthic communities?</li> <li>▪ 4.3.2.2 Develop trophic transfer model for lower food chain</li> <li>▪ 4.3.2.3 Complete laboratory toxicity tests</li> </ul>
Water and Sediment	<p>GSL Open Waters (Complex Mixing and Gain and Loss to the Water Column)</p> <p>Water Inflow from Tributaries &amp; Discharges</p>	<ul style="list-style-type: none"> <li>▪ 4.3.1.1 What contaminants pose the greatest risk to beneficial uses?</li> <li>▪ 4.3.1.2 What are the sources and loads of contaminants to the lake?</li> <li>▪ 4.3.1.3 How does lake hydrology and chemistry affect contaminants of concern?</li> <li>▪ 4.3.1.4 How do contaminants interact between water and sediment?</li> </ul>

910

911 **4.2 Common Need**

912 One need is common to all research needs, will affect how they are conducted, and eventually will  
 913 influence how the results are implemented by UDWQ and its partners and the availability of the data  
 914 to the public: the formation and maintenance of a data repository for use in UDWQ's Great Salt Lake  
 915 studies. This section summarizes this need.

916 **4.2.1 Data Repository**

917 **Problem Statement.** Effective assessments of water bodies and successful monitoring programs require  
 918 the integration of all available data from multiple sources. Local, state, federal, and other entities that  
 919 are studying Great Salt Lake need to compile and manage data and analytical reports so that the  
 920 information gathered is understandable and available to decision makers, stakeholders, and public  
 921 audiences. This can be achieved by creating an online data repository, where all lake data that meets  
 922 UDWQ's or the hosting agency's data quality standards will be submitted, managed, and accessed.

923 **Study Objective.** This project will focus on developing an approach for managing Great Salt Lake  
924 data in a way that enables UDWQ to work with data partners to set priorities, address major water  
925 quality issues, and report status and trends more effectively. The database will allow streamlined  
926 data entry and retrieval, meet data standards, and provide effective agency and stakeholder use  
927 and public access to the data.

928 **Management Objective.** This study will facilitate the storage and retrieval of quality data for use in  
929 developing water quality standards, monitoring the waters of Great Salt Lake, UPDES permitting, and  
930 assessing the lake's support of beneficial uses.

931 **Approach.** UDWQ is developing a database for statewide water quality data that will eventually  
932 include data from Great Salt Lake. UDWQ's intent is to develop independent but compatible  
933 databases for each of its special studies (e.g., development of water quality standards for selenium  
934 and Willard Spur). Upon completion of these special studies these databases will be merged with  
935 UDWQ's statewide water quality database. UDWQ will work with its partners to identify a platform  
936 that allows the public access to this database but also databases maintained by others for Great Salt  
937 Lake data.

### 938 4.3 Open Water Research

939 Three areas of research were identified to address needs for the open water of Great Salt Lake (the  
940 open water includes all of Great Salt Lake's bays but does not include their mudflats or wetlands).  
941 The three areas begin with understanding the water and sediment that serve as the foundation to the  
942 ecosystem and support of its beneficial uses. The discussion then moves to the lower and then upper  
943 trophic levels of the ecosystem. The following sections identify studies that need to be addressed to  
944 proactively fulfill UDWQ's responsibilities to protect Great Salt Lake (see Figure 4-1).

#### 945 4.3.1 Great Salt Lake Water and Sediment

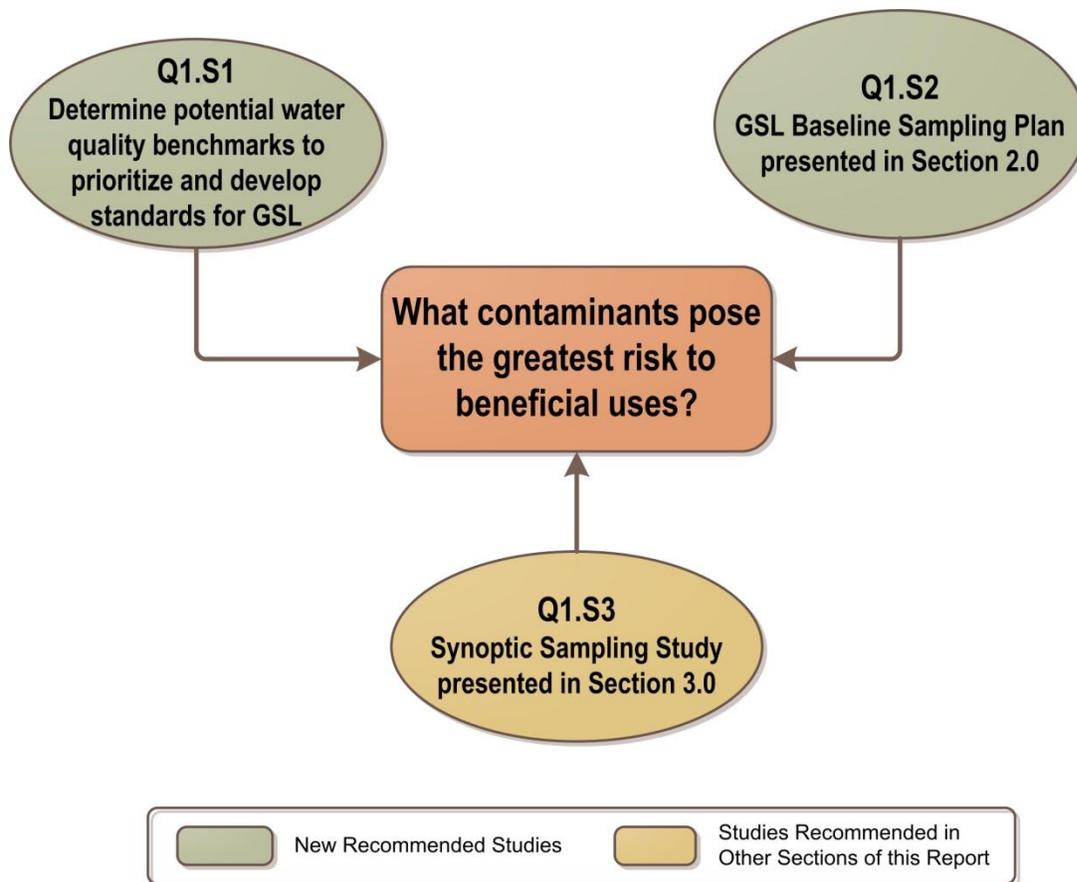

946 One of the highest priorities for establishing standards and assessing if the water quality is sufficient  
947 to meet beneficial uses is the identification of contaminants present in the lake that currently could  
948 pose risk to the ecosystem and, therefore, impair the lake's beneficial uses. As mentioned in earlier  
949 sections, some studies have already identified selenium, mercury, and some trace metals and nutrients  
950 to be of concern, but many data gaps remain. Information is needed to characterize the effects of  
951 lake hydrology and chemistry on the fate of these contaminants, to track past trends, to identify their  
952 sources, and to develop mass balance models to aid in predicting future conditions. Outcomes from  
953 these studies will support UDWQ's development of standards and assessments by identifying (1) what

954 contaminants are of concern, (2) how they are impacted by the lake’s unique saline chemistry, and  
 955 (3) how contaminant loads might be managed and regulated in the future to protect water quality  
 956 conditions in the Great Salt Lake and provide dischargers with more certainty in managing their  
 957 effluent.

958 The following subsections address each of these questions. It should be noted that some of these  
 959 questions may be addressed by the studies identified in Sections II and III or by the ongoing efforts of  
 960 partners. The objective is to better define what is known and fill in known data gaps to enable  
 961 UDWQ to proactively fulfill its responsibilities.

962 **WHAT CONTAMINANTS POSE THE GREATEST RISK TO BENEFICIAL USES?**  
 963 Figure 4-2 presents an approach of how this question will be addressed. Study number Q1.S1 is a  
 964 new study, while Studies Q1.S2 and Q1.S3 are presented in previous sections.

965 **FIGURE 4-2. APPROACH TO QUESTION 1**

967 **Determine Potential Water Quality Benchmarks to Prioritize and Develop Standards**  
968 **for Great Salt Lake**

969 **Problem Statement.** Contaminant-specific water quality benchmark concentrations can be used to  
970 define threshold values against which measured concentrations can be compared to help assess the  
971 potential effects of contaminants on water quality. Benchmarks are pollutant concentrations that are  
972 unlikely to result in adverse effects to aquatic and aquatic-dependent life. Both the USGS and EPA  
973 have benchmark concentrations for several contaminants in surface water; however, these are either  
974 for freshwater or marine water bodies. Since Great Salt Lake is unique with varying levels of salinity,  
975 these benchmarks are not applicable for all conditions. A review of the literature is required to  
976 identify potential water quality benchmarks for the salinities observed in the lake and also to  
977 determine if these benchmark concentrations appear to be appropriate for the Great Salt Lake  
978 ecosystem. More discussion of this approach and the research necessary can be found in  
979 Component 1: Proposed Approach for Developing Numeric Criteria for Great Salt Lake.

980 **Study Objectives.** The objectives for this study are as follows:

- 981  Conduct a literature review to identify Great Salt Lake organisms and potential water quality  
982 benchmarks for contaminants that have been identified to pose risks to the beneficial uses of  
983 Great Salt Lake, for waters with various salinities—from fresh to hypersaline.
- 984  Validate the applicability of these benchmark concentrations by looking at how they were  
985 derived. Were the benchmarks derived using elements of the food chain that are analogous to  
986 Great Salt Lake (e.g., a marine benchmark developed to protect fish may not be applicable to  
987 Great Salt Lake open waters)?
- 988  Compile benchmarks and supporting documentation in a report that may be reviewed and  
989 endorsed by Great Salt Lake research groups and stakeholders. The intent of the benchmarks is  
990 not to serve as numeric water criteria but to provide a tool, similar to those used in risk  
991 assessments, that can be used to evaluate Great Salt Lake’s water quality and guide future  
992 decisions.

993 **Management Objectives.** The work will inform the prioritization of pollutants and applicability for  
994 development of water quality standards for Great Salt Lake and assist in the assessment of Great  
995 Salt Lake’s support of beneficial uses.

996 **Approach.** A literature review will be conducted to define the organisms that live in and rely on the  
997 waters of Great Salt Lake for sustenance. The literature review will also identify applicable water  
998 quality standards in use today, as well as contaminant concentrations identified by researchers as  
999 significant thresholds or benchmarks for the survival of various elements in the food web. Efforts will  
1000 be focused first on the contaminants targeted by the baseline sampling plan and then be expanded  
1001 to include other possible contaminants as identified by the synoptic sampling effort or deemed

1002 necessary by UDWQ. Benchmarks will be grouped by their applicable salinity (i.e., freshwater,  
1003 marine, and hypersaline waters).

1004 Historical and ongoing water quality and other ecological data, such as collocated concentration of  
1005 contaminants in water, sediment and transfer through the food web, and any observed negative  
1006 effects on avian reproduction, may be used to determine the degree to which the presence of  
1007 contaminants in concentrations above the benchmarks demonstrate toxicity. This effort will require  
1008 collaboration with other studies identified in this section.

1009 All applicable literature will be compiled into a comprehensive review summary, including a list of  
1010 identified benchmark concentrations, name, location, and percent salinity of the water body and how  
1011 existing studies determined these benchmark concentrations. Available thresholds or benchmarks will  
1012 be evaluated in terms of the similarity of methods, organisms, or toxicological characteristics used to  
1013 derive them with parallel characteristics of Great Salt Lake. Benchmarks that were developed using  
1014 similar elements of the food web will be of particular interest. For example, benchmarks developed  
1015 for fish are not necessarily applicable to Great Salt Lake as fish do not tolerate the salinities of Great  
1016 Salt Lake.

1017 Work completed as part of this study will be conducted in coordination with UDWQ's Water Quality  
1018 Standards Workgroup.

#### 1019 **Q1 S2—Great Salt Lake Baseline Sampling Plan**

1020 Details on the Great Salt Lake baseline sampling plan are presented in Section II.

#### 1021 **Q1 S3—Great Salt Lake Synoptic Sampling Study**

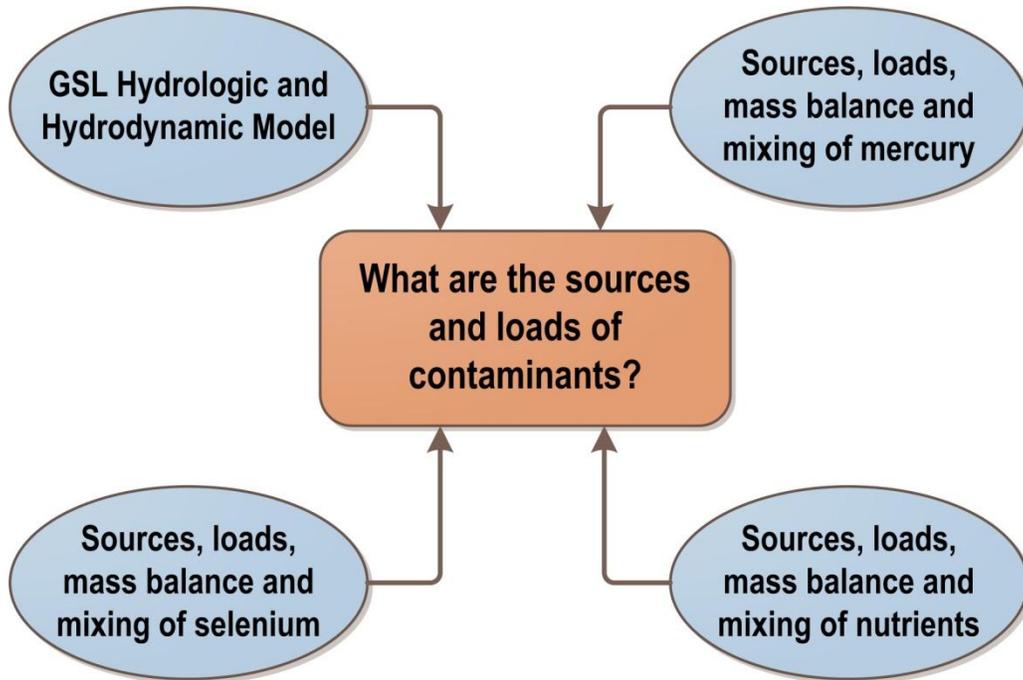

1022 Details on the synoptic sampling study are presented in Section III.

#### 1023 **WHAT ARE THE SOURCES AND LOADS OF CONTAMINANTS?**

1024 Understanding the sources and loads of contaminants that are suspected to threaten or concluded to  
1025 impair the beneficial uses of Great Salt Lake is essential protecting the water quality. Recent studies  
1026 to develop water quality standards and assess Great Salt Lake's beneficial uses for impacts from  
1027 selenium, mercury, and nutrients each resulted in an evaluation of sources and loads of these  
1028 contaminants as part of the study (Diaz et al., 2008; Naftz et al., 2008; Peterson and Gustin, 2008;  
1029 Naftz et al., 2009; UDWQ, 2011). Mass balance models have also been developed for selenium and  
1030 mercury (Johnson et al., 2006; Diaz et al., 2009; UDWQ 2011). However, these studies and models  
1031 may need to be revisited to identify gaps and to refine the understanding of where the contaminants  
1032 come from and what happens to them within the lake. Figure 4-3 presents an approach of how this

1033 question will be addressed. A similar approach will be followed if additional contaminants of concern  
 1034 are identified. Further details on these studies are presented as follows.

1035 **FIGURE 4-3. APPROACH TO QUESTION 2**

1036

1037

### 1038 **Great Salt Lake Hydrologic and Hydrodynamic Model**

1039 **Problem Statement.** The fluctuation of Great Salt Lake with climate and precipitation has an impact  
 1040 on its water quality, biological communities, and on the industries that depend on its resources. Due to  
 1041 the shallowness of the lake, small changes in lake levels result in large changes in surface area and  
 1042 create a highly variable shoreline. Changes in water quantity also have a measurable impact on lake  
 1043 salinity.

1044 Flow inputs to Great Salt Lake from tributaries and discharges have been monitored by USGS flow  
 1045 gauges as part of other studies evaluating sources of selenium, mercury and nutrients (Naftz et al.,  
 1046 2009a; Naftz et al., 2009b). Recently a study was also completed by Dr. David Tarboton at the Utah  
 1047 State University on Great Salt Lake's water budget. The USGS is currently conducting studies to  
 1048 understand how inflows to Great Salt Lake mix with the open waters at the Gilbert Bay.

1049 Though these studies have and will answer several questions on Great Salt Lake hydrology and  
 1050 hydrodynamics, to date, no comprehensive model is available that could be used to dynamically and  
 1051 reliably predict the hydrologic input and response and the hydrodynamics of Great Salt Lake. Such a

1052 model will improve the understanding of the lake dynamics, the nature and causes of its fluctuations,  
1053 and consequently assist in predicting lake fluctuations and water quality.

1054 This study will be conducted in collaboration with other past and existing research groups studying  
1055 Great Salt Lake hydrology and hydrodynamics.

1056 **Study Objectives.** The first objective of this study is to develop an accurate hydrologic model for  
1057 Great Salt Lake that will be able to predict lake inflows, outputs (e.g., evaporation), and lake levels  
1058 and will serve as a useful tool in understanding changing lake salinities and contaminant sources and  
1059 loads. The second objective of this study is to develop a hydrodynamic model of Great Salt Lake that  
1060 will incorporate the hydrologic inputs and outputs but also improve the understanding of how such  
1061 flows mix within Great Salt Lake. Such a model will be a critical first step in developing a  
1062 comprehensive fate, transport, and mixing model for nutrients and other contaminants.

1063 **Management Objectives.** The development of a hydrologic model will provide UDWQ with a  
1064 mechanism to better identify how lake salinities may change and contaminant sources and loads.  
1065 Understanding how salinity will vary will help guide the development and implementation of water  
1066 quality standards per Component 1. The development of a hydrodynamic model will provide UDWQ  
1067 with a mechanism to better understand the fate and transport of contaminants and how they may  
1068 impact Great Salt Lake's water quality. This will assist UDWQ in developing water quality standards,  
1069 improve monitoring the waters of Great Salt Lake, assist with UPDES permitting, and assess Great Salt  
1070 Lake's support of beneficial uses.

1071 **Approach.** To develop a hydrologic model, past information on flows to Great Salt Lake, evaporation  
1072 rates, and lake levels and mixing patterns will need to be compiled and analyzed. This analysis will  
1073 be useful to identify data gaps and the need for further data collection. The gaps will be addressed  
1074 and additional flow gauges will be installed if required. Existing and new information gathered will  
1075 be used to develop a robust hydrologic model for the lake.

1076 A significant element of this study will be to establish and maintain long-term flow gauges for Great  
1077 Salt Lake tributaries. These gauges will be operated in conjunction with the collection of water  
1078 samples to evaluate contaminant sources and loads entering Great Salt Lake (see studies that follow).  
1079 Thus the flow gauges will address the need to refine the hydrologic model but also to enable  
1080 estimates of contaminant loads from each tributary.

1081 The effects of surface heat flux and wind forcing on temporal and spatial variations in flow and  
1082 mixing patterns within the lake will need to be investigated numerically in a hydrodynamic model. The

1083 effect of the various Great Salt Lake causeways is also an area that has been the subject of research  
1084 but for which much remains to be understood. As previously described, the USGS has already begun  
1085 work to understand these mixing patterns; however, much remains to be understood to enable a useful  
1086 hydrodynamic model. Any model will require validation. This study will also validate the model by  
1087 collecting more data and comparing these with the predicted data by the developed model.

### 1088 **Sources, Loads, Mass Balance, and Mixing of Nutrients in Great Salt Lake**

1089 **Problem Statement.** Farmington Bay in Great Salt Lake was found to be hypereutrophic by a study  
1090 conducted by Wurtsbaugh et al. (2006). The bay receives discharges from several wastewater  
1091 treatment plants, the Jordan River, and a sewage canal. It receives nutrients from both point and  
1092 nonpoint discharges. Also, water samples collected during the summer of 2006 from the bay indicated  
1093 the presence of cyanobacterium *Nodularia spumigena*, raising concerns about the water quality of the  
1094 bay. In contrast, the algal population in Great Salt Lake, which is supported by nutrients, is an  
1095 important diet for brine shrimp and brine flies. Some studies show that Farmington Bay nutrient inputs  
1096 are critical influences on the lake, especially for Gilbert Bay (Belovsky et al., 2011). An improved  
1097 understanding of sources, loads, and a mass balance of nutrients within the lake will help in  
1098 understanding its effects and in managing them. This study will identify the sources of nutrients  
1099 entering Great Salt Lake, estimate total loads, and develop a mass balance and mixing model for  
1100 nutrients in Great Salt Lake.

1101 **Study Objectives.** This study will begin with identifying the sources and loads of nutrients from  
1102 tributaries and municipal and industrial discharges to the lake, as well as from flux through sediments,  
1103 if any, and in developing a mass balance of nutrients in the lake. A nutrient and biological mixing  
1104 model will then be created for the lake of nutrient fate and transport. This information will then be  
1105 used to inform the UDWR's brine shrimp population dynamics model.

1106 **Management Objectives.** Understanding the sources, fate, and transport of nutrients into and within  
1107 Great Salt Lake will inform the UDWR's brine shrimp population dynamics model to better assess the  
1108 lake's support of its beneficial uses. It will also support the monitoring of Great Salt Lake's waters and  
1109 the prioritization and development of water quality standards, if needed.

1110 **Approach.** Quantification and modeling of nutrients and water column biota response provides the  
1111 crucial biological uptake and chemical recycling that is the underpinning for any subsequent  
1112 waterborne contaminant fate and transport modeling for the lake. The studies and modeling must  
1113 begin with the development of an accurate hydrodynamic model with added components to describe  
1114 salinity and nutrient dynamics.

1115 Hydrodynamic model components have been previously described; additional data to support a full  
1116 nutrient mixing model include the following:

- 1117  Quantification of all influent loads of key nutrient species
- 1118  Internal sediment losses and fluxes to the water column
- 1119  Atmospheric loading
- 1120  Water column planktonic processing and transformation of nutrients; seasonal measurements of  
1121 algal biomass, chlorophyll, and nutrient content

1122 This model will inform the UDWR's efforts and assist both agencies in assessing Great Salt Lake's  
1123 beneficial uses.

#### 1124 **Sources, Loads, Mass Balance, and Mixing of Selenium in Great Salt Lake**

1125 **Problem Statement.** Naftz et al. (2008b) conducted a study to identify the sources and loads of  
1126 selenium entering the South Arm of Great Salt Lake. Both continuous and noncontinuous stream gages  
1127 were used to collect flow data from inflows to the South Arm and the concentration of total selenium,  
1128 as well as selenium species, were measured to evaluate loads to the lake. The study concluded that  
1129 additional unquantified sources may be contributing substantial masses of selenium load to Great Salt  
1130 Lake. These sources may include loads entering from unmeasured surface inflows, groundwater  
1131 discharge, wind-blown dust that is deposited directly on the lake surface, wet and dry atmospheric  
1132 deposition falling directly on the lake surface, and lake sediment pore-water diffusion into the  
1133 overlying water column (internal loading). A separate mass balance was also developed for selenium  
1134 in the South Arm (Diaz et al., 2009a); however, increases in total selenium concentration during the  
1135 study also indicated the possibility of unquantified sources entering the lake.

1136 To understand the effects of selenium in the Great Salt Lake ecosystem and be able to manage its  
1137 loads in the flows entering the lake, it is essential to have a strong knowledge of sources of selenium  
1138 and its mass balance in the lake. This will also include sources to Bear River Bay and Farmington Bay.  
1139 An accurate quantification of internal loading and exchange between sediments, the deep brine  
1140 layer, and the surface layers will be critical to understanding the behavior of selenium and other  
1141 elements in the lake. Such an understanding will enable UDWQ to better link the effect incoming loads  
1142 of selenium have on its concentration in lake water.

1143 **Study Objectives.** The objectives of this study are as follow:

- 1144  Identify the sources and loads of selenium entering the South Arm of Great Salt Lake that were  
1145 not addressed by Naftz et al. (2008b)

- 1146  Identify and quantify sources and loads of selenium in Bear River and Farmington Bay
- 1147  Refine and validate the selenium mass balance model developed by Diaz et al. (2009a)

1148 **Management Objectives.** This study will develop a mass balance model that can be used by UDWQ  
1149 to verify existing water quality standards, verify that current methods for setting limits on acceptable  
1150 selenium discharges to Great Salt Lake are appropriately protective, and assist UDWQ to meet its  
1151 obligations if selenium in Footnote 14 is exceeded.

1152 **Approach.** As previously mentioned, the USGS and research teams from the University of Utah have  
1153 recently completed studies on understanding sources and loads of selenium entering Great Salt Lake.  
1154 The USGS is currently looking at groundwater discharge as a potential mechanism for additional  
1155 sources of selenium to Great Salt Lake. For this research work, it is important to collaborate with these  
1156 teams to build on existing data and fill in gaps in current understanding.

1157 The components of a mass balance model for selenium will include all sources of external and internal  
1158 loading to the water column as well as a quantification of the loss terms of permanent burial and  
1159 volatilization. All of these factors need to be tied to a loading and mixing model that accommodates  
1160 influent loads and hydrodynamic mixing in the lake. Such a model will be an effective tool to predict  
1161 lakewide selenium concentrations that may occur in the future in response to changes in external  
1162 loading.

1163 There is a lack in the complete understanding of volatilization of selenium from the lake. Thus,  
1164 improving this understanding through literature review and sample collection and analysis will be an  
1165 objective. Also, efforts will be made to address the uncertainties in measurement of volatilization.

### 1166 **Sources, Loads, Mass Balance and Mixing of Mercury in Great Salt Lake**

1167 **Problem Statement.** Methyl-mercury concentrations that have resulted in impairments in other waters  
1168 in the United States have been measured in Great Salt Lake. Some Great Salt Lake waterfowl are  
1169 contaminated with mercury making them unfit for human consumption. These findings prompted  
1170 considerable research to characterize mercury concentrations in various media, as well as efforts to  
1171 identify sources of mercury to Great Salt Lake. Recently, UDWQ, in collaboration with the USGS,  
1172 completed a study that estimated loads of total mercury to the lake through its riverine inputs and as  
1173 a result of atmospheric deposition (UDWQ, 2011; Naftz et al., 2009). The study concluded that most  
1174 of the total mercury present in the South Arm is likely contributed by atmospheric deposition of  
1175 mercury. The load from atmospheric deposition was found to be far more than what was being  
1176 discharged by the riverine inputs to Gilbert Bay. Though no further needs were specifically identified  
1177 in the study, it is important to better understand how mercury is being methylated within Great Salt

1178 Lake so that solutions to this problem may be evaluated. Similar to selenium, a mass balance and  
1179 mixing model of mercury also needs to be developed. Knowledge of these will help understand and  
1180 predict how the existing loads might affect the Great Salt Lake ecosystem in the future and thus  
1181 inform decision making.

1182 **Study Objectives.** The goal of this study is to identify the unquantified sources of mercury to Gilbert  
1183 Bay, to develop a mass balance and mixing model of mercury for the lake, and to better understand  
1184 the mechanisms that regulate the methylation of mercury in Great Salt Lake.

1185 **Management Objectives.** Methyl-mercury has been identified to be a potential problem in Great  
1186 Salt Lake and could impair its beneficial uses. Understanding the sources of mercury, its mass balance,  
1187 and how the lake regulates the methylation of mercury in Great Salt Lake will enable UDWQ to  
1188 quantify water quality problems, establish water quality goals, assess beneficial use support, and  
1189 determine the effectiveness of pollution control programs.

1190 **Approach.** Many of the data needs for this study are the same as for selenium mass balance studies,  
1191 and efforts will be synchronized with the selenium study and the hydrodynamic model previously  
1192 presented. Additional work is needed to create the analogous quantification of mercury (and  
1193 methyl-mercury, as needed) in water, sediment, and biota, as was done for selenium. Ongoing  
1194 research into the methylation of mercury will be supported, particularly to understand the role of  
1195 bacteria and the deep brine layer.

#### 1196 HOW DOES LAKE HYDROLOGY AND CHEMISTRY AFFECT CONTAMINANTS OF CONCERN?

1197 **Problem Statement.** Lake levels and basic lake chemistry characteristics such as salinity, dissolved  
1198 oxygen, pH, temperature, density, and clarity play an important role in affecting the fate and  
1199 transport and in transforming the contaminants that enter the lake. It is essential to understand what  
1200 happens to these contaminants within the lake waters to gain knowledge on their fate, as well as in  
1201 regulating them. Such general knowledge is an important component of the loading, fate, transport,  
1202 and mixing models for various constituents used to develop water quality standards, assess water  
1203 quality, and developing UDPEs permit discharge limits.

1204 **Study Objective.** Explore available data to determine relationships between primary contaminants  
1205 and Great Salt Lake water chemistry and hydrology as may affect contaminant fate and transport.

1206 **Management Objectives.** This work will inform the prioritization and development of water quality  
1207 standards, how UPDES permits are structured and implemented, and improve the monitoring of Great  
1208 Salt Lake waters and assessment of its beneficial uses.

1209 **Approach.** This question can be addressed using data gathered by the baseline sampling plan  
1210 described in Section II and the synoptic sampling plan presented in Section III. While the baseline  
1211 sampling plan will monitor biannual trends in the primary contaminants listed previously, the synoptic  
1212 sampling plan includes extensive monthly or bimonthly sampling across the lake including the  
1213 contaminants that have been identified to pose risk to the beneficial uses of Great Salt Lake and  
1214 other water quality parameters that would represent the lake hydrology and chemistry. Further, the  
1215 synoptic sampling event is to be completed on a 5-year basis. Analysis of these data could be used to  
1216 study how varying chemistry and hydrology (i.e., inflows, lake level) affect contaminant chemistry.

#### 1217 HOW DO CONTAMINANTS INTERACT BETWEEN WATER AND SEDIMENT

1218 **Problem Statement.** Many contaminants, such as selenium and mercury, are found naturally within  
1219 Great Salt Lake's watershed. However, it is also widely recognized that the inflow of these  
1220 contaminants has most likely increased since the watershed has developed and urbanized (Naftz et  
1221 al., 2000). The lake's natural processes would likely cause many of these contaminants to precipitate  
1222 from the water column and be deposited in lake sediments. Thus, Great Salt Lake's sediment provides  
1223 an invaluable record of how conditions in Great Salt Lake have changed with time.

1224 This study seeks to better understand the sedimentation rates throughout Great Salt Lake, long-term  
1225 precipitation rates of various contaminants, and the permanent burial loss rates of contaminants. The  
1226 use of brine shrimp cysts found in the sediment column can be used as an additional marker of historic  
1227 Great Salt Lake productivity.

1228 **Study Objective.** The objective of the proposed study is to provide answers to the following questions:

- 1229  What are the historic sedimentation rates throughout Great Salt Lake (confirm and build on the  
1230 work completed by Johnson et al. [2008] for the UDWQ selenium study)?
- 1231  What are the historical trends in concentrations of contaminants that have been identified to pose  
1232 risk to the beneficial uses of Great Salt Lake?
- 1233  What are their sedimentation/precipitation rates?
- 1234  Do contaminants in sediments release to the water column of the Great Salt Lake as a result of  
1235 lake chemistry and natural sediment diagenesis and is such sediment flux affected by changing  
1236 lake chemistry (deep brine layer movements, seasonal anoxia, etc.)?
- 1237  What is the permanent burial rate of key contaminants?

1238 **Management Objectives.** Understanding the effect of legacy sediments upon the water quality of  
1239 Great Salt Lake and the fate of contaminants that are discharged to Great Salt Lake is essential to

1240 the development of water quality standards, focusing monitoring efforts, developing appropriate  
1241 UPDES permits, and assessing the support of Great Salt Lake's beneficial uses.

1242 **Approach.** To determine historical trends in concentrations of contaminants, sediment cores are a  
1243 commonly implemented method. This procedure determines prehistorical conditions and the impact of  
1244 human activity in a watershed. Some sediment core studies have already been done for the Great  
1245 Salt Lake, focusing on reconstructing historical changes in Great Salt Lake and also on selenium and  
1246 mercury (Naftz et al., 2000; Naftz et al., 2008; Naftz et al., 2009a; Naftz et al., 2009b; Oliver,  
1247 2008; UDWQ, 2011). Information from these studies will be used to design new data collection as  
1248 needed. Sediment core samples were also collected and analyzed to determine sedimentation rates  
1249 of selenium by Oliver et al. (2009). It should be noted that a new study of Great Salt Lake sediment  
1250 cores is currently underway; however, information pertaining to project objectives was not available  
1251 at the time of this writing. A similar approach will be adapted to determine the sedimentation rates of  
1252 other contaminants in Great Salt Lake.

1253 Several studies may be required to address the objectives listed previously. While funds may become  
1254 available to address one objective (i.e., study contaminant levels in sediment for one contaminant),  
1255 such a study should be coordinated with UDWQ to leverage this effort to also address as many other  
1256 objectives as possible. This may require cost-sharing to obtain additional samples and/or complete  
1257 further analyses. Following are a list of suggested studies:

- 1258  Review past work to establish sedimentation rates throughout Great Salt Lake. Complete  
1259 additional sediment cores studies as needed to refine the map developed by Oliver (2008).  
1260 Existing and new cores will be dated using lead-210 and cesium to understand sedimentation  
1261 rates and how contaminant levels in sediment have changed with time. The objective is to better  
1262 understand where efforts to understand historic contaminant deposition will be targeted.
- 1263  Sediment cores collected as part of Item 1 will be analyzed to address, at a minimum, the primary  
1264 constituents of selenium, mercury, nitrogen, and phosphorus. Combined with sedimentation rates,  
1265 trends in contaminant levels will be identified both temporally and spatially across the lake. The  
1266 stratigraphy of intact cores and porewater can be used to estimate diffusive flux rates to and  
1267 from the overlying water.
- 1268  Laboratory studies with intact cores to quantify contaminant flux (e.g., Byron and Ohlendorf,  
1269 2007).

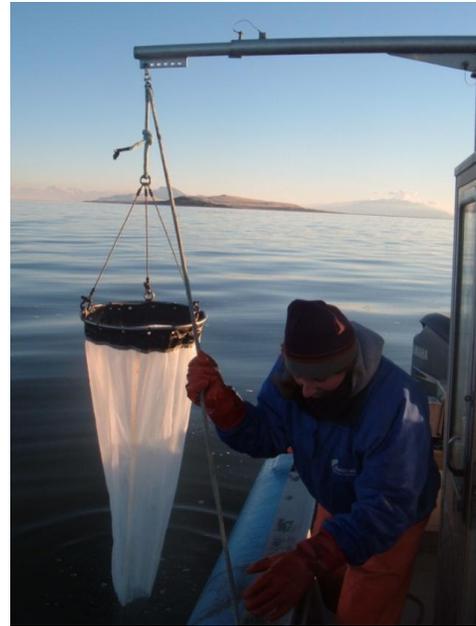

1270 Release of contaminants from sediment to water column can be inferred by collecting collocated  
1271 water column and sediment samples. All water quality parameters, such as pH, dissolved oxygen,  
1272 temperature, clarity, and salinity, will be measured along with sample collection. Data from these  
1273 sampling efforts will be used in conjunction with core and flux studies to determine any flux of  
1274 contaminants into or out of the sediments.

### 1275 4.3.2 Great Salt Lake Lower Food Chain

1276 The lower food chain components of Great Salt Lake are represented by planktonic and benthic  
1277 species, such as algae, bacteria, and macroinvertebrates. Maintaining healthy populations of these  
1278 species is essential for the Great Salt Lake ecosystem, as they form the critical aquatic food chain for  
1279 the millions of migratory birds that use the lake water during nesting and wintering.

1280 Contaminants and nutrients in water may pose a risk either  
1281 because they are toxic to lower organisms; passed up the  
1282 food chain to higher species such as birds, fishes, and  
1283 humans; or because they negatively affect primary and  
1284 secondary production in water. Contaminants may  
1285 bioaccumulate or nutrients can cause eutrophication, resulting  
1286 in adverse health and reproductive effects, or have negative  
1287 impact directly on the ecosystem, such as eutrophication  
1288 caused by the presence of excess nutrients. Whatever the  
1289 scenario, understanding the fate and transport of these  
1290 contaminants and nutrients from water and sediment to the  
1291 components in Great Salt Lake food web is important for  
1292 setting standards and assessing if bioaccumulative  
1293 contaminants or nutrients are adversely affecting the  
1294 ecosystem.

FIGURE 4-4. SAMPLING BRINE SHRIMP ON  
GILBERT BAY

1295 The following sections present studies that need to be addressed to improve the current understanding  
1296 of the Great Salt Lake lower food chain (see Figure 4-1).

1297 WHAT ARE THE EFFECTS OF SALINITY ON PLANKTONIC AND BENTHIC COMMUNITIES?

1298 **Problem Statement.** The salinity of Great Salt Lake is spatially and temporally diverse across the  
1299 open waters and the wetlands. It is saturated in the Gunnison Bay, varies between 6 to 15 percent  
1300 across the Gilbert Bay, remains low in the Farmington and the Bear River Bay  
1301 (<http://ut.water.usgs.gov/greatsaltlake/salinity/index.html>), and is almost negligible in the wetlands  
1302 depending on the lake level and freshwater inflow to the wetlands. It also varies with depth at certain  
1303 locations in Gilbert Bay where the deep brine layer is present. Such variations create environments for  
1304 different types of planktonic and benthic species to grow and survive. However, to maintain and  
1305 manage the Great Salt Lake ecosystem and its beneficial uses, it is essential to protect those habitats  
1306 that provide food sources to brine shrimp, brine flies, and other macroinvertebrates. Thus, it is

1307 important to gain an understanding of how salinity might affect the growth and survival of these  
1308 essential species.

1309 **Study Objectives.** This study will focus on understanding the effects of salinity on planktonic and  
1310 benthic species in Great Salt Lake and will provide answers to the following questions:

- 1311  What species are supported by the varying percent salinity in the Gilbert Bay?
- 1312  What species are supported in Farmington Bay, Bear River Bay, and their associated wetlands  
1313 and how are they different from those in Gilbert Bay? How does varying salinity affect these  
1314 species?
- 1315  How are critical Great Salt Lake invertebrates affected by the saturated conditions of  
1316 Gunnison Bay?

1317 **Management Objectives.** Understanding how and what causes salinity to vary in Great Salt Lake  
1318 and how changing salinity may affect the planktonic and benthic communities is important to  
1319 developing water quality standards that are appropriate for (see Component 1) and accurately  
1320 assessing the beneficial uses that can be supported by a given salinity.

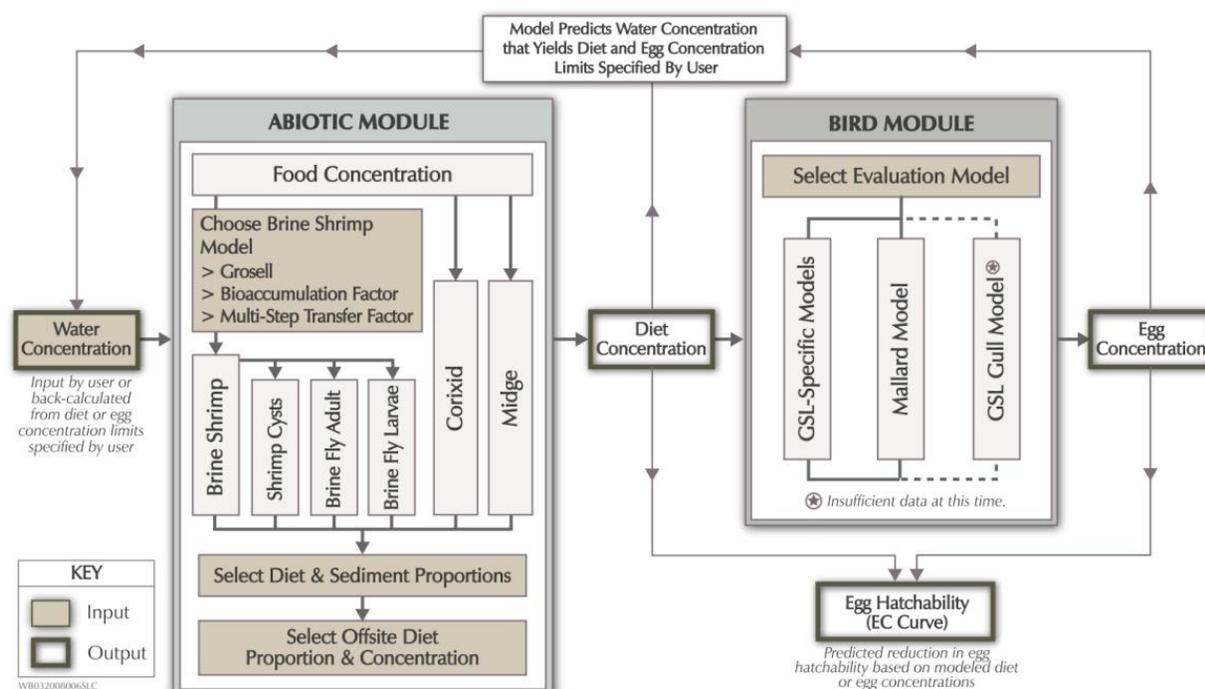

1321 **Approach.** The UDWR has been enumerating and studying planktonic and benthic communities of  
1322 Great Salt Lake as part of the Great Salt Lake Ecosystem Program research. The Great Salt Lake  
1323 Institute at Westminster College has also been completing groundbreaking work on the role bacteria  
1324 play in Great Salt Lake. This study will be completed in collaboration with the UDWR and the Great  
1325 Salt Lake Institute.

1326 Planktonic and benthic organisms will be sampled at two locations in Farmington Bay and Bear River  
1327 Bay, respectively; two locations in the North Arm; and four locations in the South Arm, each  
1328 representing different percent salinity. Organisms can be collected from the deep brine layer, if  
1329 observed. During sampling, field measurements of water quality parameters, especially salinity, will  
1330 be documented. All samples will be identified and enumerated. Appropriate statistical methods will  
1331 be applied to evaluate correlations between variables.

1332 Results will be compared with research completed by the UDWR and Great Salt Lake Institute and  
1333 evaluated in terms of the salt balance model developed by the USGS and Utah Division of Water  
1334 Resources. The end product will be a report summarizing the ranges of salinity observed and what  
1335 drives changes in salinity for each of Great Salt Lake's water bodies. A discussion will be provided  
1336 linking Great Salt Lake organisms to these salinities and how they respond to changes.

## 1337 DEVELOP TROPHIC TRANSFER MODEL FOR LOWER FOOD CHAIN

1338 **Problem Statement.** Understanding trophic relationships for bioaccumulative contaminants, such as  
 1339 selenium, mercury, and arsenic, is an important part of advancing our knowledge on the dynamics of  
 1340 these contaminants in Great Salt Lake, as well is in management and decision making to protect the  
 1341 beneficial uses of Great Salt Lake. In 2008, as a part of UDWQ's extensive effort to assess the  
 1342 effects of selenium in Gilbert Bay's ecosystem, Marden (2008) conducted a study to determine trophic  
 1343 relationship of selenium in water, seston, and brine shrimp. However, these relationships were  
 1344 concluded not to be robust by the author, who suggested further investigation into the same. Similarly,  
 1345 UDWQ completed another study in collaboration with USGS, Utah Department of Natural Resources  
 1346 (DNR), USFWS, and EPA in 2011 (UDWQ, 2011) that developed a conceptual model to illustrate the  
 1347 ecological receptors and exposure routes of mercury concentration in Great Salt Lake. This study  
 1348 identified data gaps in correlations of concentration of mercury in parts of the Great Salt Lake food  
 1349 chain.

1350 **FIGURE 4-5. GREAT SALT LAKE TROPHIC TRANSFER MODEL FOR SELENIUM**

1351

1352 Thus, there is a need to improve the existing trophic transfer and bioaccumulative models and expand  
 1353 them for use across all Great Salt Lake water bodies. This study will focus efforts to establish a robust  
 1354 trophic transfer relationship in Great Salt Lake only of those contaminants that have been identified to  
 1355 pose a bioaccumulative risk. Though presented as a single study here, this project may be divided into  
 1356 several subcategories, each handling a single contaminant.

1357 **Study Objectives.** The objective of this study is to establish trophic transfer relationships of  
1358 bioaccumulative contaminants in Great Salt Lake between water, benthic and planktonic species, and  
1359 different life stages of brine shrimp and brine flies in a way that will be robust and could be used in  
1360 developing water quality standards, determining UPDES permit limits, and assessing the support of  
1361 Great Salt Lake's beneficial uses.

1362 **Management Objectives.** Bioaccumulative contaminants are of concern for the aquatic food chain but  
1363 also for the health of Great Salt Lake birds and the humans who consume them. Understanding how  
1364 these contaminants enter and bioaccumulate in the food chain is essential to applying eventual water  
1365 quality standards to UPDES permits and assessing if Great Salt Lake is supporting its beneficial uses.

1366 **Approach.** Collocated samples of water, brine shrimp and their cysts, and brine fly larvae and pupae  
1367 will be collected from the lake. Data from the baseline sampling plan and synoptic sampling studies  
1368 could be used but may need to be augmented to capture

1369 Statistical relationships, useful for improving existing biodynamic models and establishing new models,  
1370 can be developed based on the analysis of seasonal and synoptic data. The data can be developed  
1371 into trophic dynamic relationships (ratios) describing trophic transfer coefficients between water and  
1372 invertebrates (or water, seston, and invertebrates). Alternatively, regression relationships can be used  
1373 to infer causal relationships between water-borne and tissue concentrations for various contaminants.  
1374 The relationships and resulting models can be used in support of ecological risk assessment, the  
1375 development of standards for the lake, or studies in support of the brine shrimp industry.

#### 1376 COMPLETE LABORATORY TOXICITY TESTS

1377 **Problem Statement.** Component 1 includes the possibility of completing laboratory toxicity tests as  
1378 part of the process for the development of water quality standards for Great Salt Lake. UDWQ will  
1379 first complete a review of the literature to identify available toxicity data that are pertinent to the  
1380 organisms and salinities observed in Great Salt Lake. If data gaps exist, then UDWQ will need to  
1381 complete laboratory toxicity tests to determine the toxicity of various contaminants to organisms that  
1382 exist in Great Salt Lake and in the salinities they experience. This information is critical for the  
1383 development of numeric criteria that are protective of these organisms and the beneficial uses they  
1384 represent.

1385 UDWQ is currently evaluating which organisms, salinities, and contaminants are relevant to the  
1386 development of water quality standards for Great Salt Lake and will be completing a literature  
1387 review to define appropriate toxicity data and benchmarks for use in Great Salt Lake. As such, the  
1388 actual number and targets for the toxicity tests are unknown at this time.

1389 **Study Objective.** The objective of these studies is to determine the toxicity of specific contaminants to  
1390 the organisms that exist in the various salinities of Great Salt Lake.

1391 **Management Objective.** Laboratory toxicity tests are an essential element in developing water  
1392 quality standards that can be used to assess the beneficial uses of Great Salt Lake (see  
1393 Component 1).

1394 **Approach.** Per the literature review previously discussed, UDWQ will identify data gaps in available  
1395 toxicity data for the organisms and salinities observed in Great Salt Lake. Critical toxicity endpoints  
1396 will be identified and prioritized and then laboratory toxicity tests will be designed and implemented.  
1397 The approach and level of effort for completing a laboratory toxicity test depends on the  
1398 contaminant and toxicity endpoint being evaluated (e.g., acute systemic, dietary, or reproductive).  
1399 Care must be given to ensure the studies address the proper pathway of administration, measure of  
1400 toxicity, time and number of exposures, form of the contaminant used, and the appropriate endpoint.

#### 1401 **4.3.3 Great Salt Lake Upper Food Chain**

1402 The upper food chain of Great Salt Lake is represented by several species of birds that visit the lake  
1403 every year for wintering and nesting. The Great Salt Lake is extremely important to migratory birds.  
1404 One of the most important roles the Great Salt Lake ecosystem has to play is sustaining the migratory  
1405 birds using the Pacific Flyway and a portion of the Central Flyway. It supports millions of shorebirds,  
1406 as many as 1.7 million eared grebes, and hundreds of thousands of waterfowl during spring and fall  
1407 migration every year (<http://ut.water.usgs.gov/greatsaltlake/>). For some species, the Great Salt Lake  
1408 ecosystem is important for breeding, for others the area is important during migration, and for still  
1409 others the lake provides important wintering habitat. Some species use the lake for more than one  
1410 aspect of their natural history. The lake and its marshes provide a resting and staging area for birds,  
1411 as well as an abundance of brine shrimp, brine flies, and other invertebrates that serve as their food.  
1412 As previously described, these birds are not only important to the Great Salt Lake ecosystem but also  
1413 to the recreation industry and the health of those who hunt and eat waterfowl. It is thus evident that  
1414 understanding and sustaining the avian population in the Great Salt Lake ecosystem is of utmost  
1415 importance.

1416 Studies have been conducted to identify and enumerate the different avian species in and around  
1417 Great Salt Lake (Manning and Paul, 2003; Cavitt, 2006; Cavitt, 2008a; Cavitt, 2008b) and much  
1418 work has been done to understand the effects of contaminants on avian population  
1419 (CH2M HILL, 2008; Vest et al., 2009). The UDWR continues to complete research to understand the  
1420 use of Great Salt Lake by birds and how to better manage this resource. However, scientific

1421 uncertainty exists, and there is a need for further research to enable UDWQ to accurately assess this  
1422 beneficial use.

1423 The following sections present these research needs.

#### 1424 HOW DOES THE AVIAN POPULATION USE GREAT SALT LAKE?

1425 **Problem Statement.** The UDWR conducted a 5-year study concluding in 2001 to identify the species  
1426 of waterbirds and enumerate them through a bird survey (Paul and Manning, 2002; Manning and  
1427 Paul, 2003). These comprehensive surveys were conducted from 1997 to 2001 and focused on areas  
1428 where birds were most abundant including the Great Salt Lake surface, shoreline, and associated  
1429 wetlands, including the three major  
1430 delta regions and nearby wetland  
1431 complexes that drain into Great Salt  
1432 Lake. This study identified 55 water  
1433 bird species that use the lake and  
1434 highlighted the effect of lake  
1435 elevation on bird use and numbers.

1436 The UDWR continues to conduct  
1437 large-scale bird surveys, and the  
1438 USFWS is currently monitoring nesting  
1439 birds in Bear River Migratory Bird  
1440 Refuge.

FIGURE 4-6. WATERFOWL AT FARMINGTON BAY

1441 There have been some focused efforts to survey Great Salt Lake birds (Cavitt, 2006; Cavitt, 2008a;  
1442 Cavitt, 2008b). These studies were designed to provide specific information relating to diet and  
1443 contaminant exposure. Although reproductive success is the most critical endpoint for most contaminant  
1444 effects, a secondary critical endpoint is adequate body condition, which is required by birds using the  
1445 lake to successfully survive the winter and migrate. Migratory non-nesting species, such as eared  
1446 grebes, phalaropes, and over-wintering ducks, depend on the lake and may be affected by food-  
1447 borne contaminants during their time on Great Salt Lake or as they continue their migration. These  
1448 migratory non-nesting species will be monitored if there is reason to believe they are more sensitive to  
1449 contaminants than nesting species. In addition, little is known about the contaminant levels in that these  
1450 birds are carrying when they arrive at the lake and whether lake contaminants affect their survival  
1451 after they leave the lake. Periodic surveys are required to track changes in the number and species of  
1452 birds using the lake. Tracking avian populations also serves as an important indicator of the  
1453 environmental conditions of Great Salt Lake and other water systems they might use along their

1454 migratory paths. Thus, studies will be completed to survey avian species that use Great Salt Lake for  
1455 foraging, wintering, and nesting. As the UDWR is already conducting similar research, UDWQ's work  
1456 will serve to encourage, coordinate, and collaborate to address specific issues that pertain to the  
1457 assessment of Great Salt Lake's beneficial uses.

1458

1459 **Study Objectives.** The objectives of these studies will be to conduct bird surveys to identify avian  
1460 species that use Great Salt Lake for foraging, wintering, and nesting; identify the areas they use for  
1461 these purposes; and evaluate how these populations change in terms of location, foraging, and  
1462 nesting.

1463 **Management Objectives.** Understanding which avian species use the lake, how they use it, and where  
1464 they use it are important for the development of water quality standards, monitoring the Great Salt  
1465 Lake's waters, and UPDES permitting. Most importantly, this work will inform UDWQ's assessment of  
1466 Great Salt Lake's beneficial uses.

1467 **Approach.** Comprehensive surveys by agencies such as the UDWR and USFWS that track population  
1468 use and trends by species will be encouraged and supported and these data, along with other historic  
1469 survey data, and will be used as an indicator of lake-wide bird use as related to environmental  
1470 conditions. Avian surveys conducted by the UDWR (2001; Manning and Paul, 2003) will be used as  
1471 the baseline for a long-term avian monitoring program. These surveys will be conducted periodically  
1472 using the same methods as the UDWR study used and is currently using.

1473 Surveys will be targeted to complete the following:

1474  Surveys will be conducted of migratory species breeding at Great Salt Lake. Species, their  
1475 numbers, and the locations they use for foraging and nesting will be tracked to identify  
1476 population trends. Foraging patterns and diet items will be determined for each species so as to  
1477 determine if and how contaminants may put these birds at risk. In addition, studies will be  
1478 designed that will monitor contaminant levels in the eggs of birds that use Great Salt Lake waters  
1479 as a food source and breed along its shores (note that selenium and mercury in bird eggs is  
1480 monitored as part of the baseline sampling plan).

1481  Surveys will be conducted of migratory nonbreeding species using methods similar to the surveys  
1482 being conducted for nesting birds at the lake. Species, their numbers, and the locations they use  
1483 for foraging will be tracked to identify population trends. Foraging patterns and diet items will  
1484 be determined for each species so as to determine if and how contaminants may put these birds  
1485 at risk. In addition, studies will be designed that will monitor contaminant levels in birds arriving at  
1486 Great Salt Lake and their accumulation during their stay. Birds will be tracked to determine  
1487 survival after they leave Great Salt Lake to move on to their breeding grounds.

## 1488 DEVELOP TROPHIC TRANSFER MODEL FOR UPPER FOOD CHAIN

1489 **Problem Statement.** Understanding trophic relationships for bioaccumulative contaminants, such as  
1490 selenium, mercury, and arsenic, is an important part of advancing our knowledge on the dynamics of  
1491 these contaminants in Great Salt Lake, as well as in assessing the beneficial uses of Great Salt Lake.  
1492 As a part of UDWQ's extensive effort to assess the effects of selenium in the Great Salt Lake  
1493 ecosystem, Cavitt (2008b) and Conover et al. (2008a) conducted studies to determine trophic  
1494 relationships of selenium in water, sediments, macroinvertebrates, adult birds, and bird eggs for  
1495 shorebirds and California Gulls. A conceptual model was developed by CH2M HILL describing the  
1496 bioaccumulation of selenium from water to brine shrimp (adult and cyst) and diet to bird egg.  
1497 However, improvements were suggested in these relationships, including improving confidence in  
1498 relating water concentrations to bird egg condition. Another study by UDWQ in collaboration with the  
1499 Utah DNR, USGS, USFWS, and EPA

1500 on ecological assessment of  
1501 mercury on Great Salt Lake also  
1502 underlined the need for more  
1503 information on correlation of  
1504 contaminants in avian species and  
1505 their diets. Current EPA guidance  
1506 for implementing tissue based  
1507 water quality standards for  
1508 methyl-mercury recommend the  
1509 development of these relationships  
1510 to support permitting.

1511 **Sampling Shorebirds to Link**  
1512 **Diet to Bird Egg**

1513 This study will establish a robust  
1514 trophic transfer relationship  
1515 between avian species, their eggs,  
1516 and their diets in Great Salt Lake  
1517 of those contaminants that have  
1518 been identified to pose a risk to the beneficial uses of Great Salt Lake.

1519 Though presented as a single study here, this project may be divided into several subcategories, each  
1520 handling a single contaminant.

FIGURE 4-7. TRAP SET OVER A SHOREBIRD NEST TO CAPTURE MOTHER HEN TO LINK DIET OF MOTHER HEN TO EGGS

1521 **Study Objectives.** The objective of this study is to establish trophic transfer relationships of  
1522 bioaccumulative contaminants in Great Salt Lake between avian diet, adult avian species, and their  
1523 eggs in a way that will be robust and can be used in Great Salt Lake management decisions.

1524 **Management Objectives.** Bioaccumulative contaminants are of concern for the aquatic food chain but  
1525 also for the health of Great Salt Lake birds and the humans who consume them. Understanding how  
1526 these contaminants enter and bioaccumulate in the food chain is essential to applying eventual water  
1527 quality standards to UPDES permits and assessing if Great Salt Lake is supporting its beneficial uses.

1528 **Approach.** The results of previous studies on the feeding and nesting habits of birds and the results of  
1529 the bird egg monitoring study for selenium and mercury on Great Salt Lake presented will support this  
1530 study.

1531 It can be difficult to establish a relationship between concentrations of contaminants in  
1532 macroinvertebrates, adult birds, and bird eggs because the proportion of dietary items can be vastly  
1533 different among individuals. This study will collect samples of macroinvertebrates that the birds feed  
1534 on on a weekly basis for about 5 weeks before the nesting season. This will provide a good picture of  
1535 the variability of contaminants in the diet that the birds are exposed to during the egg production  
1536 period. The relation to adult birds will be established by either trapping or drawing blood samples  
1537 from nesting birds or harvest adult birds and collecting blood and liver samples for the analysis of  
1538 contaminants.

1539 While establishing a work plan for this study, it will be essential to collaborate with agencies, such as  
1540 the USFWS, that are currently researching contamination in bird eggs and their risks to avian  
1541 reproduction.

1542 HOW DO SELENIUM AND MERCURY AFFECT GREAT SALT LAKE AVIAN POPULATIONS?  
1543 Selenium and mercury have been the focus of research since 2006. While much has been learned,  
1544 much remains to be understood to assess their impact on beneficial uses, in particular to the avian  
1545 population of Great Salt Lake. The following work addresses key issues that pertain to UDWQ's  
1546 monitoring of Great Salt Lake, evaluation of that data, and assessing Great Salt Lake's beneficial  
1547 uses.

#### 1548 **Bird Egg Monitoring for Selenium and Mercury in Great Salt Lake**

1549 As part of the baseline sampling plan (see Section II) and to support the assessment of Great Salt  
1550 Lake beneficial uses, UDWQ monitors selenium and mercury concentrations in adult avocet and stilt  
1551 eggs and their associated food web (i.e., water, sediments, and macroinvertebrates).

1552 **Studies to Understand the Potential Interaction Between Selenium and Mercury and their**  
1553 **Effects on Aquatic Birds**

1554 **Problem Statement.** The ecological assessment studies conducted by UDWQ on selenium and mercury  
1555 in Great Salt Lake (UDWQ, 2011; CH2M HILL, 2008) identified the need to understand the  
1556 interaction of selenium and mercury and their effects on the avian species in the open waters of Great  
1557 Salt Lake. During the selenium assessment study, high selenium concentrations were found in the blood  
1558 and liver of shorebirds (American avocets and black-necked stilts) compared with those identified in  
1559 invertebrate food sources. One possible explanation posed for the high concentrations found at Great  
1560 Salt Lake was the potential interaction with elevated mercury concentrations (Santolo and Ohlendorf,  
1561 2006). Both mercury and selenium seem to act antagonistically forming a stable complex. This  
1562 complex may act to increase both the retention and buildup of mercury and selenium in tissues. The  
1563 interaction of these two contaminants in eggs and the effects to embryos is very complex. Eggs with  
1564 elevated selenium alone seem to have lower hatchability than eggs with elevated selenium and  
1565 mercury; however, the deformity rate appears to be higher in the eggs with selenium and mercury.  
1566 This study will focus on addressing and understanding this issue.

1567 **Study Objectives.** The objective of this study is to understand the interaction of selenium and mercury  
1568 in avian species of Great Salt Lake and to understand how this interaction might adversely affect  
1569 them.

1570 **Management Objectives.** Understanding whether there is a significant interaction between selenium  
1571 and mercury in the avian species of Great Salt Lake is critical for accurately interpreting results from  
1572 UDWQ's monitoring program, developing water quality standards, evaluating UPDES permits, and  
1573 assessing Great Salt Lake's beneficial uses.

1574 **Approach.** UDWQ will approach this issue in two phases. The first phase will build on the data  
1575 obtained from the selenium study completed by UDWQ in 2008 to confirm observations that were  
1576 made. This will require measuring mercury levels from the sample sites of the selenium study, as well  
1577 as analyzing concentrations of mercury in bird tissues. This will provide information and reasoning for  
1578 the higher-than-expected blood selenium concentrations that were found in selenium study  
1579 (CH2M HILL, 2008). Concentrations of mercury in the kidneys of birds that were archived during the  
1580 study will be measured. Some studies on interactions of selenium and mercury in birds have looked at  
1581 kidneys as well as blood and liver. Analyzing kidneys for mercury will not only determine if there was  
1582 elevated concentration of mercury at the sample locations but also may determine if the higher  
1583 selenium concentrations found in blood were due to higher mercury than the other sites.

1584 The second phase of research will focus on laboratory toxicity tests to evaluate the observed  
 1585 interaction and its effect on the beneficial use. This phase of research will require close coordination  
 1586 with the UDWR and the USFWS.

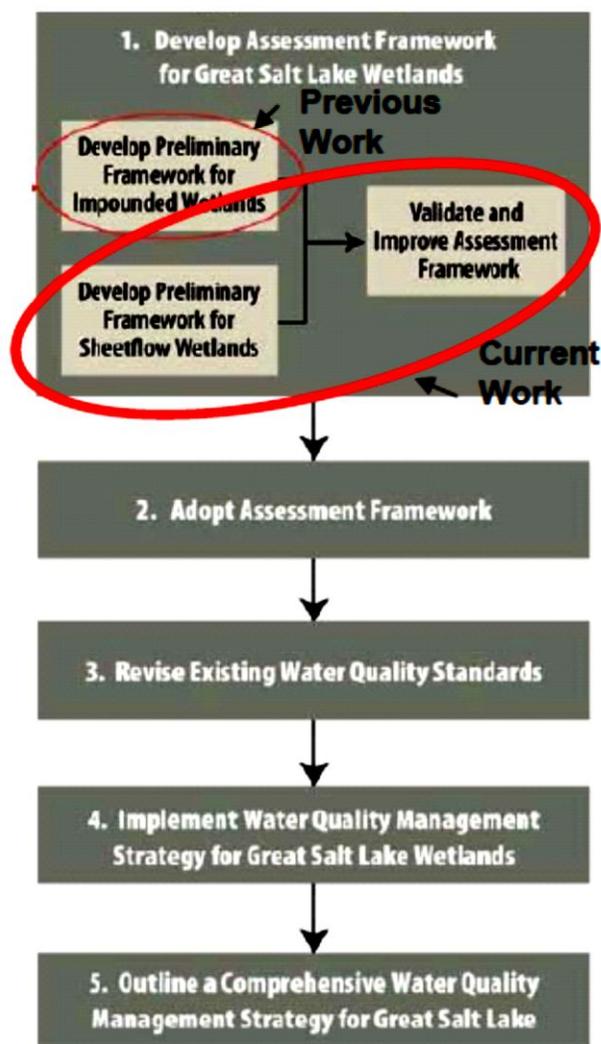

#### 1587 4.4 Wetland Research

1588 Concerns about the potential impact nutrient loads may be having on Great Salt Lake wetlands have  
 1589 prompted UDWQ and others to initiate two wetlands research programs since 2004. In 2004, a study  
 1590 was initiated to characterize the ecosystem of Farmington Bay, with a goal of understanding the  
 1591 physical, chemical, and ecological processes that were critical to the integrity of Farmington Bay's  
 1592 ecosystem. This program evolved into the  
 1593 development of a wetland assessment framework  
 1594 to be used to evaluate the relative condition of  
 1595 Great Salt Lake impounded wetlands. In 2011,  
 1596 UDWQ initiated the Willard Spur sampling and  
 1597 research program, with the objective of  
 1598 understanding how to better protect the beneficial  
 1599 uses of Willard Spur waters. These two research  
 1600 programs have and are making progress in  
 1601 improving the understanding of Great Salt Lake  
 1602 wetlands; however, further study is required to  
 1603 enable UDWQ to effectively protect the  
 1604 beneficial uses of these wetlands. This section  
 1605 summarizes ongoing research but also identifies  
 1606 additional needs.

##### 1607 4.4.1 Wetland Assessment Framework

1608 **Problem Statement.** Research to characterize  
 1609 Great Salt Lake's wetlands has uncovered  
 1610 numerous new questions regarding how these  
 1611 wetlands may be best protected. Complexities in  
 1612 the biological, chemical, and ecological function of  
 1613 the wetlands makes determination of suitable  
 1614 numeric criteria for these wetlands difficult and  
 1615 time consuming. Discussion of using only narrative

FIGURE 4-8. UDWQ'S PROPOSED APPROACH FOR GREAT SALT LAKE WETLANDS WATER QUALITY STRATEGY

1616 criteria to protect the wetlands meets with significant concern as narrative criteria alone may not be  
1617 adequate to protect the beneficial uses. Regardless of the water quality standards that are  
1618 implemented in the future, an assessment framework for the wetlands of Great Salt Lake is vital to  
1619 moving forward. This framework, and the science that defines it, will serve as the baseline for  
1620 documenting if and how the beneficial uses of these wetlands are protected. This framework will also  
1621 serve as the foundation for a new, proposed approach to managing the wetlands of Great Salt Lake.

1622 **Study Objective:** The objective of this research is to develop an assessment framework that can be  
1623 used by UDWQ to assess the relative condition of Great Salt Lake wetlands and identify areas that  
1624 may not be supporting their beneficial uses. UDWQ can then complete focused research on these  
1625 areas to be able to determine if they are supporting their beneficial uses.

1626 **Management Objectives.** This research will support the development of appropriate water quality  
1627 standards for Great Salt Lake wetlands, monitoring of these waters, and assessing their support of  
1628 beneficial uses.

1629 **Approach.** UDWQ and others have invested significant resources to better understand the dynamics  
1630 of Great Salt Lake wetlands (Miller and Hoven, 2007; Gray, 2005; Gray, 2009; Rushforth and  
1631 Rushforth, 2006a, b, c, d; Rushforth and Rushforth, 2007). A preliminary assessment framework was  
1632 proposed for Great Salt Lake impounded wetlands in 2009 using data collected beginning in 2004  
1633 (CH2M HILL, 2009). UDWQ is currently working to validate the assessment framework for impounded  
1634 wetlands and develop a new preliminary assessment framework for fringe wetlands. The preliminary  
1635 assessment framework for impounded wetlands focused on developing metrics for four assemblages:  
1636 macroinvertebrates, submerged aquatic vegetation, surface mats, and water chemistry. Ongoing work  
1637 to validate this framework will investigate the viability of other indicators such as diatoms and bird  
1638 use and important factors such as hydrology. Work to develop a preliminary assessment framework  
1639 for fringe wetlands will begin using work summarized in Miller and Hoven (2007).

#### 1640 **4.4.2 Development of Water Quality Standards for Willard Spur**

1641 **Problem Statement.** Construction of the Perry/Willard Regional Wastewater Treatment Plant (Plant)  
1642 was completed in 2010. The UDWQ received numerous comments as part of the public notice process  
1643 for the Plant's UPDES discharge permit to Willard Spur. Many of these comments expressed concern  
1644 over the potential impact the effluent could have on the water body and petitioned the UDWQ to  
1645 prohibit all wastewater discharges to Willard Spur or to alternatively reclassify Willard Spur to  
1646 protect the wetlands and current uses of the water.

1647 Although the Utah Water Quality Board denied the petition, the Water Quality Board directed  
 1648 UDWQ to develop a study design to establish defensible protections (i.e., site-specific numeric  
 1649 criteria, antidegradation  
 1650 protection clauses, beneficial use  
 1651 changes, etc.) for the water  
 1652 body. The Water Quality Board  
 1653 also directed UDWQ to pay  
 1654 for phosphorus reductions at the  
 1655 Plant while the study is  
 1656 conducted. This path forward,  
 1657 developed in conjunction with  
 1658 stakeholders, allows the Plant to  
 1659 operate while the studies are  
 1660 underway, with reasonable  
 1661 assurances that the effluent will  
 1662 not harm the ecosystem.

FIGURE 4-9. A JANUARY MORNING AT WILLARD SPUR

1663 **Study Objective.** The Willard Spur Science Panel was charged with the responsibility to identify and  
 1664 oversee the studies required to address the question: “What water quality standards are fully  
 1665 protective of beneficial uses of Willard Spur waters as they relate to the proposed publicly owned  
 1666 treatment works (POTW) discharge?” This question represents the overall program objective.

1667 Two questions were identified that follow from the program objective (i.e., these questions must be  
 1668 answered for the program objective to be achieved). The questions are as follows:

- 1669 1. What are the potential impacts of the Perry Willard Regional Wastewater Treatment Plant  
 1670 on Willard Spur?
- 1671 2. What changes to water quality standards will be required to provide long term protection of  
 1672 Willard Spur as they relate to the proposed POTW discharge?

1673 **Management Objective.** The objective of this work is to develop appropriate water quality  
 1674 standards and methods for monitoring and assessing the support of Willard Spur’s beneficial uses.

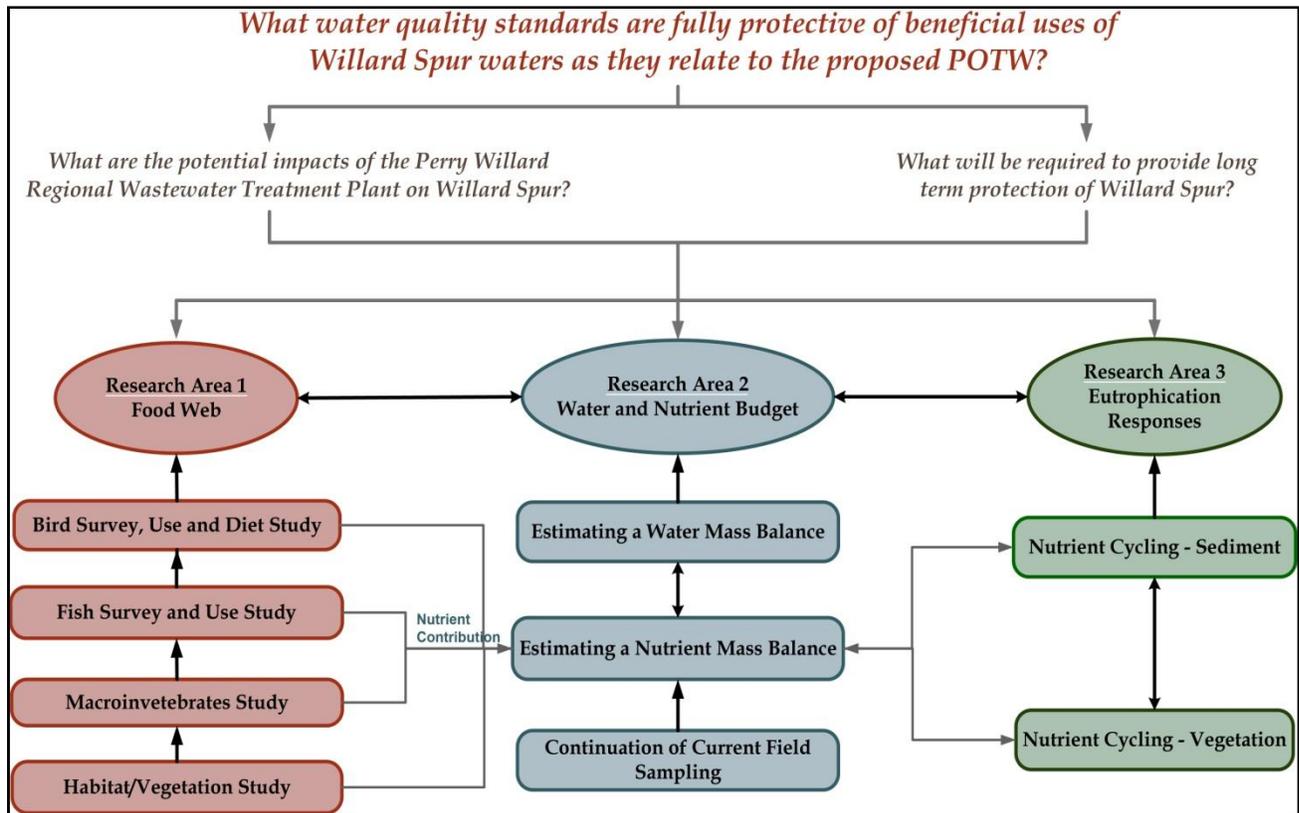

1675 **Approach.** To provide answers to these questions, the Willard Spur Science Panel identified the three  
 1676 following key research areas:

- 1677 1. Define and understand the food web of Willard Spur

- 1678 2. Define the water and nutrient budget for Willard Spur
- 1679 3. Define responses to eutrophication within Willard Spur

1680 A Research Plan (CH2M HILL, 2011) was developed to closely follow the conceptual models defined  
 1681 in a memorandum dated August 2, 2011 (“Draft Conceptual Models”). Figure 4-10 illustrates how the  
 1682 various research studies fit into this structure as well as accomplish the overall program objective.  
 1683 While this research is focused on Willard Spur, much of the understanding that is gained will apply  
 1684 directly to other Great Salt Lake wetlands. Research across Great Salt Lake wetlands will be closely  
 1685 coordinated and integrated to leverage the knowledge gained and focus efforts on areas of less  
 1686 understanding.

1687 **FIGURE 4-10. OVERALL STRUCTURE OF PROPOSED RESEARCH WORK AT WILLARD SPUR**

1688

1689 **4.4.3 Additional Wetland Research Needs**

1690 **DEVELOP WETLAND RESEARCH FRAMEWORK**

1691 **Problem Statement.** While UDWQ’s current research programs are working to develop a  
 1692 fundamental understanding of Great Salt Lake wetlands and how to protect them, there are numerous  
 1693 additional areas that require research. An important realization is that as more is learned about

1694 Great Salt Lake wetlands, the  
1695 more researchers understand  
1696 that they do not know. Much  
1697 research can be done without  
1698 addressing management  
1699 objectives. Thus it is essential  
1700 that a research framework be  
1701 developed that is based on  
1702 clear objectives endorsed by  
1703 Great Salt Lake wetlands  
1704 stakeholders. It is important  
1705 that new research be focused  
1706 and prioritized in such a way  
1707 that it incorporates previous  
1708 research, addresses specific gaps in knowledge, and addresses management objectives.

FIGURE 4-11. WETLANDS NEAR OGDEN BAY

1709 **Study Objective.** To develop a research framework that UDWQ and its partners can use to  
1710 understand each others' objectives, acknowledge previous research, identify and prioritize research to  
1711 address gaps in understanding, coordinate efforts, and document progress.

1712 **Management Objective.** The objective of this work is to develop a framework that facilitates  
1713 effective collaboration to develop water quality standards, monitor, and assess the beneficial uses of  
1714 Great Salt Lake wetlands.

1715 **Approach.** UDWQ will work with its partners to develop this research framework. The framework will  
1716 identify key objectives for research, key stressors that are of concern, responses to those stressors,  
1717 factors that can influence the response, and how those stressors may affect beneficial uses. The  
1718 framework will consolidate much of the above into a conceptual model, ideally developed for each  
1719 unique stressor. UDWQ has already developed two preliminary conceptual models that were used to  
1720 guide research for Willard Spur. These conceptual models will be reviewed and new conceptual  
1721 models be developed to frame our current understanding. UDWQ will then work with its partners to  
1722 identify which components have already been addressed through previous research and which areas  
1723 require additional research and then, together with stakeholders, prioritize efforts in such a way that  
1724 management objectives can be met. The framework will be revisited with stakeholders to communicate  
1725 progress and coordinate efforts.

## 1726 ADDITIONAL RESEARCH NEEDS

1727 Following are questions and issues that have been raised as part of other research studies. Research  
1728 will be completed in these areas to ensure that UDWQ's strategy to protect wetlands is well informed,  
1729 defensible, and focuses on the right indicators and factors. More areas will likely be identified as part  
1730 of the development of the research framework previously described. The areas of research are as  
1731 follows:

- 1732 1. What is the influence of legacy nutrients and metals in wetland sediments upon the water quality  
1733 and beneficial uses of these wetlands?
- 1734 2. What factor do metals in sediments play in observed responses that have generally been  
1735 attributed to nutrients (Miller et al., 2011)?
- 1736 3. Why do submerged aquatic vegetation appear to senesce earlier in "impacted" impounded  
1737 wetlands vs. "reference" sites? Does this indicate that beneficial uses are not being supported?
- 1738 4. Does the presence of surface algal mats indicate that beneficial uses are not being supported?
- 1739 5. What role does water quality play in the propagation of invasive species such as phragmites?  
1740 How do these invasive species influence other indicators that UDWQ is considering for use in  
1741 assessing Great Salt Lake wetlands?
- 1742 6. Many Great Salt Lake impounded wetlands are managed systems. What factor does the altered  
1743 hydrology play in the observed responses? Can hydrologic manipulations be improved to improve  
1744 water quality? (See also CH2M HILL, 2012.)
- 1745 7. How does the apparent early senescence of submerged aquatic vegetation and presence of  
1746 surface algal mats affect the avian beneficial use of Great Salt Lake impounded wetlands?
- 1747 8. Further develop mapping and database infrastructure for Great Salt Lake wetlands to integrate  
1748 scientific knowledge, work efforts, and resources among researchers.
- 1749 9. Complete a landscape-level HGM-based reclassification of Great Salt Lake wetlands for use as a  
1750 sampling frame in future wetland assessments.

## 1907 APPENDIX A: QUESTIONS OF INTEREST

1908 The following questions represent results from an initial “brainstorming” session completed by  
1909 CH2M HILL to identify potential questions that the Great Salt Lake Sampling and Research Program  
1910 may address. Research questions developed to understand water quality standards required for the  
1911 protection of beneficial use in Willard Spur, from the Utah Division of Water Quality’s (UDWQ’s)  
1912 ongoing Willard Spur program were also integrated into the list to address water quality issues in  
1913 Great Salt Lake wetlands. This is not intended to be a comprehensive list but is intended to stimulate  
1914 discussion, prioritization, and identification of questions to be addressed by a sampling program  
1915 undertaken by UDWQ.

1916 **1. What are current concentrations of various contaminants in water, sediments, and tissues**  
1917 **from Great Salt Lake (e.g., selenium, mercury, arsenic, copper, zinc, nutrients, cyanotoxins,**  
1918 **etc.) and how do they vary?**

- 1919 a) Which contaminants pose the greatest risk to the beneficial uses of Great Salt Lake?
- 1920 b) What methods should be used to sample, handle, and analyze water, sediments, and tissues  
1921 from Great Salt Lake?
- 1922 i) What Standard Operating Procedures (SOPs) should be used for sampling and handling  
1923 samples?
- 1924 ii) What quality assurance procedures should be used for sampling, handling, and analyzing  
1925 samples (Quality Assurance Project Plan [QAPP])?
- 1926 iii) What laboratory should be used for analyzing samples of different types (recognizing  
1927 different laboratories may be needed for different media)? Required certifications?
- 1928 c) How do concentrations of these contaminants vary in water?
- 1929 i) How do they vary by salinity, clarity, temperature, pH, dissolved oxygen, and density of  
1930 Great Salt Lake water?
- 1931 ii) How do they vary by depth and location? Is the lake well-mixed? Can we sample the lake  
1932 in only one or two locations and correctly assume they are representative of the lake?
- 1933 iii) How do they vary by month and year? Are they linked to lake level? Can we collect  
1934 samples in different seasons?

- 1935 d) How do concentrations of these contaminants vary in sediment?
- 1936 i) What are the sediment characteristics and how have deposition rates/patterns changed  
1937 spatially and temporally?
- 1938 ii) How do they vary by location? By depth of sediment? Can or should sediments be dated?
- 1939 iii) What is the sediment oxygen demand (SOD) in Great Salt Lake? How does it change  
1940 spatially and temporally? What processes control or drive SOD in Great Salt Lake?
- 1941 e) Do these contaminants cycle between sediments and water column and how?
- 1942 i) What controls sediment and pore water chemistry in the lake? Does it change spatially  
1943 and temporally?
- 1944 ii) How much of the contaminants load is stored in sediments? How much of the sediment  
1945 stores are available for reintroduction into the system?
- 1946 iii) What is the current sediment/water exchange rate for various contaminants of concern in  
1947 Great Salt Lake? How does it change spatially and temporally? What processes control or  
1948 drive this flux?
- 1949 iv) How does it affect macroinvertebrate and submerged aquatic vegetation (SAV)  
1950 populations, especially in the wetlands? Do sulfide and metal concentrations play a major  
1951 role?
- 1952 f) How do concentrations of these contaminants vary in lower food chain items (e.g., seston, brine  
1953 shrimp, brine flies and other macroinvertebrates)?
- 1954 i) How do concentrations in water vs. seston correlate?
- 1955 (1) What is the composition of seston? What species of algae are present, when, where?
- 1956 ii) How do concentrations in water vs. seston vs. brine shrimp correlate?
- 1957 iii) How do concentrations in water/sediment vs. brine fly larvae vs. brine fly adults  
1958 correlate?
- 1959 iv) How do concentrations in water vs. brine shrimp cysts correlate?
- 1960 v) How do concentrations in water vs. other macroinvertebrates correlate?
- 1961 vi) Collect adult brine shrimp and cysts from a variety of locations and archive them.
- 1962 g) How do concentrations of these contaminants vary in avian populations?

- 1963 i) How do concentrations in water vs. food chain vs. bird tissue (i.e., blood, liver, egg) vary?  
1964 By location? Time of year?
- 1965 1. What species of birds currently use Great Salt Lake? What are their populations?  
1966 How do the numbers vary throughout the year?
- 1967 2. Where do the birds nest and feed? What are they eating, when, where?
- 1968 3. How has bird use (species and population) changed over time in Great Salt Lake? Are  
1969 the birds opportunistic or specific in what they are looking for?
- 1970 4. How does bird use (species or population) vary with changes in habitat, water level,  
1971 and water quality?
- 1972 5. How does concentration of contaminants in lower food chain vs. avian population  
1973 correlate?
- 1974 h) How are concentrations of these contaminants influenced by salinity?
- 1975 **2. Do current mercury levels present a risk to the beneficial uses of Great Salt Lake?**
- 1976 a) What are mercury concentrations in collocated water, sediment, algae, macroinvertebrates,  
1977 zooplankton, and bird tissues and eggs?
- 1978 i) What form of mercury is observed and in what quantity in these various media?
- 1979 ii) What methods should be used for sample collection, handling, and analysis?
- 1980 (1) Do we report data on wet-weight or dry-weight basis (regardless of which is used,  
1981 moisture percentage also should be reported to facilitate conversion from one to the  
1982 other)?
- 1983 iii) Are differences in analytical methods/results between laboratories significant?
- 1984 b) Do existing mercury concentrations represent an impairment of Great Salt Lake beneficial  
1985 uses?
- 1986 i) What thresholds or benchmarks (i.e., indirect indicators) are appropriate for mercury in  
1987 the Great Salt Lake environment (i.e., food chain and bird tissues)?
- 1988 (1) How sensitive are the various species to mercury? What species is most sensitive?
- 1989 (2) Are common thresholds in the literature for freshwater applicable to Great Salt Lake?
- 1990 (3) Does presence of selenium mitigate toxic effects of mercury in birds?

- 1991 (4) Does the salinity of Great Salt Lake influence toxic effects?
- 1992 ii) What is our level of certainty regarding pathway of mercury into bird tissues?
- 1993 (1) Are we confident what (and where) the birds we are sampling are eating at Great
- 1994 Salt Lake? Can we link bird tissue concentrations to the food they were eating?
- 1995 (2) Can we link bird egg concentrations to the adults that laid eggs and food they ate?
- 1996 (3) How much time do particular species of birds spend on the lake? How much of the
- 1997 mercury observed in bird tissues is from Great Salt Lake? How much of it is from
- 1998 nearby freshwater habitats? How much of it is “imported” by migrants?
- 1999 (4) Does the time and location birds are sampled affect observed concentrations? How
- 2000 does the residence time of birds correlate with time the bird was sampled?
- 2001 iii) Do mercury concentrations represent an impairment of Great Salt Lake beneficial uses?
- 2002 (1) Do concentrations adversely affect the survival, growth, or reproduction of algae,
- 2003 brine shrimp, brine flies, waterfowl, or shorebirds?
- 2004 c) What are the sources of mercury?
- 2005 i) What is the mercury balance for Great Salt Lake? What holes are there in understanding?
- 2006 ii) What is the atmospheric contribution of mercury to Great Salt Lake?
- 2007 iii) What is the contribution of mercury from Great Salt Lake tributaries?
- 2008 iv) What is the rate of mercury deposition to and release from Great Salt Lake sediments?
- 2009 Can permanent sediment burial be estimated?
- 2010 v) What is the mercury load in the water column? Shallow brine layer vs. deep brine layer?
- 2011 vi) What is source of mercury for the deep brine layer?
- 2012 vii) What controls the formation of methyl mercury in Great Salt Lake?
- 2013 **3. Do current nutrient concentrations present a risk to the beneficial uses of Great Salt Lake?**
- 2014 a) What are the current concentrations or values for the following: nutrients, chlorophyll a,
- 2015 dissolved oxygen, cyanotoxin, algal species composition, and secchi depth? What are the
- 2016 composition, frequency, extent and duration of algal blooms?
- 2017 i) How do they vary spatially?
- 2018 ii) How do they vary temporally?

- 2019           iii) How do they vary by nutrient concentration in water?
- 2020           iv) What methods should be used for sample collection, handling, and analysis?
- 2021           v) Are differences in analytical methods/results between laboratories significant?
- 2022           b) Do existing nutrient concentrations cause impairment of Great Salt Lake beneficial uses?
- 2023           i) Which of the following indicators provide the best information regarding risk to the
- 2024           beneficial uses of Great Salt Lake? Are there others?
- 2025           (1) Algal biomass (chlorophyll a)
- 2026           (2) Trophic State Index values
- 2027           (3) Dominance of blue-green algae
- 2028           (4) Number, extent and duration of algal blooms
- 2029           (5) Nutrient concentrations and ratios
- 2030           (6) Dissolved oxygen concentrations
- 2031           (7) Cyanotoxin concentrations
- 2032           ii) What thresholds or benchmarks (i.e., indirect indicators) are appropriate for indicators of
- 2033           nutrient enrichment in the Great Salt Lake environment?
- 2034           (1) How does salinity affect these thresholds?
- 2035           (2) How do they affect algal, brine shrimp, and brine fly populations?
- 2036           (3) Do any of the indicators directly affect avian populations (i.e., habitat, feeding)?
- 2037           (4) Do any of the indicators directly affect the recreational use of Great Salt Lake?
- 2038           c. Does presence of nutrients affect the availability of food and preferred habitats of the avian
- 2039           population using Great Salt Lake?
- 2040           **4. Can our understanding of selenium bioaccumulation and cycling in Great Salt Lake be**
- 2041           **improved?**
- 2042           a) Improve the current model describing bioaccumulation of selenium from water to brine shrimp
- 2043           (adult and cyst) and diet to bird egg. Would like to improve confidence in relating water
- 2044           concentrations to bird egg condition.
- 2045           i) What are the concentrations of selenium in collocated shorebird eggs and food items?
- 2046           ii) What are the concentrations of selenium in collocated water, seston, and brine shrimp?

- 2076 i) What is the annual hydrograph of incoming flows to Great Salt Lake from tributary  
2077 streams?
- 2078 ii) What is the annual cycle of lake levels on Great Salt Lake? How does it correspond to  
2079 incoming flows?
- 2080 iii) How do evaporation rates vary with salinity?
- 2081 (1) Do we have a means to collect continuous climate data?
- 2082 (2) How to evaporation pan rates vary across the area of the lake?
- 2083 iv) How does salinity vary across the different areas of Great Salt Lake (e.g., North Arm,  
2084 South Arm, Bear River Bay, Farmington Bay, Ogden Bay, etc.)?
- 2085 v) What is the depth of deep brine layer? What drives its size and location?
- 2086 vi) Validate UGS water and salt balance model.
- 2087 (1) How might future development affect hydrology of Great Salt Lake?
- 2088 (2) What are flow patterns in Great Salt Lake? What drives flow patterns?
- 2089 (3) How does temperature vary by depth/location? What drives temperature variations?
- 2090 (4) What is the bathymetry across all regions of Great Salt Lake?
- 2091 vii) How much of the salinity variation can be explained by volume vs. north/south arm flow  
2092 interaction and precipitated salt in north arm?
- 2093 viii) What impact do the causeways have upon salinity and flow patterns?
- 2094 ix) What is the relationship between inflows and lake level and salinity?
- 2095 x) What methods should be used for sample collection, handling, and analysis?
- 2096 xi) Are differences in analytical methods/results between laboratories significant?
- 2097 b) How does salinity define the characteristics of the ecosystem across Great Salt Lake?
- 2098 i) How are algal populations affected by salinity?
- 2099 ii) How are brine shrimp populations affected by salinity?
- 2100 iii) How are brine fly populations affected by salinity?
- 2101 iv) How are avian populations affected by salinity?
- 2102 c) What levels of salinity represent important thresholds that limit or impair beneficial uses?

- 2103 **6. Do current *E. coli* bacteria concentrations present a risk to the beneficial uses of Great Salt**  
2104 **Lake?**
- 2105 a) What are concentrations of *E. coli* in waters of Great Salt Lake?
- 2106 i) How do they vary temporally and spatially?
- 2107 ii) What methods should be used for sample collection, handling, and analysis?
- 2108 iii) Are analytical methods/results between laboratories significant?
- 2109 b) Do existing *E. coli* concentrations represent an impairment of Great Salt Lake beneficial uses?
- 2110 i) What thresholds or benchmarks (i.e., indirect indicators) are appropriate for *E. coli* in the  
2111 Great Salt Lake environment?
- 2112 ii) How representative are *E. coli* as an indicator organism for bacteria and viruses,  
2113 particularly pathogens, in the Great Salt Lake water column?
- 2114 **7. Any other factors that might present a risk to the beneficial uses of Great Salt Lake?**
- 2115 a) Do other potential contaminants present a risk to the beneficial uses of Great Salt Lake?
- 2116 i) What metals/metalloids are present and in what form, e.g., arsenic, zinc, aluminum, etc.?
- 2117 ii) What cyanotoxins are present, where, and in what concentrations?
- 2118 iii) What other contaminants, as listed by the United States Environmental Protection Agency  
2119 (EPA) as “Contaminants of Emerging Concern” (CECs) are detectable in Great Salt Lake  
2120 water and/or at levels of toxicological concern? Such classes of chemicals include:
- 2121 (1) Persistent organic pollutants such as polybrominated diphenyl ethers (PDBEs) and other  
2122 organics
- 2123 (2) Pharmaceuticals and personal care products including human-prescribed drugs, over  
2124 the counter medicines, and bactericides.
- 2125 (3) Veterinary medicines (various antibiotics and hormones)
- 2126 (4) Endocrine-disrupter chemicals including organochlorine pesticides
- 2127 (5) Nanomaterials (little known of environmental fate and effects)
- 2128 b) What thresholds or benchmarks (i.e., indirect indicators) are appropriate for these  
2129 contaminants in the Great Salt Lake environment (i.e., food chain and bird tissues)?

- 2130 **8. How do habitat/vegetation vary in Great Salt Lake wetlands are what drives the variations?**
- 2131 a) What is the existing distribution and biomass of vegetation, including emergent vegetation,  
2132 submerged aquatic vegetation, invasive species, phytoplankton, and algae, within Great Salt  
2133 Lake wetlands?
- 2134 b) How does this distribution affect habitat and change spatially and temporally with changing  
2135 water levels, season, and water quality?
- 2136 c) What does the literature reveal about a link between invasive species and nutrients and  
2137 changes in habitat and use by wildlife?
- 2138 d) What role does vegetation play in the cycling of contaminants in Great Salt Lake wetlands?
- 2139 e) What controls the response of emergent vegetation, SAV, phytoplankton, and algae and how  
2140 do they interact? How do contaminants affect these elements and their response?
- 2141 f) How do emergent vegetation, SAV, phytoplankton, and algae contribute to the contaminant  
2142 loads?
- 2143
